Data Classification Standard

Kitara uses four classes. The owner of a data set chooses the class. When in doubt, choose the higher class.

Public

Information already published or meant for the public, such as product guides, the Customer Charter and annual reports.

Internal

Information for staff only, such as circulars, procedures and the staff directory.

Restricted

Information limited to named departments, such as customer account data, claims files, loan files, committee minutes and personal data of customers.

Confidential

Information limited to named people. This includes salary data, national identity numbers held in bulk, investigation files, board remuneration papers, regulator enforcement correspondence and the reinsurance programme.

Marking

Documents carry the class in the header or footer. Data sets carry it in the data catalogue entry. A data set with no class is treated as restricted until the owner decides.

Examples by department

- Retail Banking: product guides are public. Customer account data is restricted. A bulk list of national identity numbers is confidential.
- Claims: claim forms and claim letters are restricted. A life claim with a medical report is confidential.
- Human Resources: the staff directory is internal. Personnel files are restricted. Salary bands and disciplinary cases are confidential.
- Finance: published accounts are public. The general ledger is restricted. Board remuneration papers are confidential.
- Legal and Compliance: regulatory notices are internal or public. Enforcement correspondence is confidential.

Handling rules

Public and internal documents may be shared by email inside Kitara. Restricted documents are shared only with the departments named in the document properties, and only through the shared drive link. Confidential documents are shared only with named people, are never printed without the owner's approval, and are encrypted when sent outside Kitara.

Changing a class

The owner may raise a class at any time. Lowering a class needs the written agreement of Legal and Compliance. A data set that mixes classes takes the highest class of any field in it.

Review

The owner reviews each data set's class every year, and again whenever the content of the data set changes.
