DA12 Checkpoint one: load, summarise, chart and explain

Week 4, Clean and chart | Session 12 of 24 | Python for Data Analysis

Today's question. What do the Sunrise Shops sales tell us about the three shops?

Objective. By the end: you can read a table, check it, summarise it, chart it and explain two findings and one limit, from a restarted notebook.

Before this session: DA11 Charts that say what the numbers say. If you cannot explain the last example, use its error card with the instructor first.

Make

In DA12.ipynb use sunrise_sales.csv. 1) Report the number of rows and the total revenue. 2) Check for missing values and duplicates and report the counts. 3) Total the revenue by branch with names from a dictionary and sort the result. 4) Draw one labelled chart. 5) Write two findings and one limitation in text cells. Restart the kernel, run all cells from the top, save and submit DA12.ipynb with a short report.pdf or report.docx through the route in START_HERE.pdf.

Save your work as DA12. Keep the worked example and put your own attempt below it. Write two sentences: what you changed and how you checked it.

Error card

You see	It means	Fix
The numbers differ after a restart	A cell relies on a value that was created in a cell that no longer runs first.	Restart the kernel and run all cells from the top. Fix the first cell that fails.
The total does not match 6375900	A filter, copy or merge changed the number of rows.	Print len() after each step and find where the count changes.

Exit ticket

My notebook reruns from the top and every number in my findings appears in an output.

AI use follows AI_USE_POLICY.pdf. In weeks 1 to 6 no AI-generated solutions are used for exercises, labs or assessments. Practise for 20 to 30 minutes between classes by repeating the Make task with one value changed. If you are stuck for 30 minutes, save the error and bring it to class. A file saved on your laptop has not been submitted until you use the route in START_HERE.pdf.
