Applied AI and Automation for Executives

12 sessions of 2 hours | 24 hours | dates and format agreed with you

Session 0 is an introduction with no activities: how AI and machine learning work, the fields and jobs behind them, and a handbook to read before Session 1.

You choose one real, recurring task from your own company in the first session and carry it through the whole course. By the end you have a working automation for it, a measured result, a written AI-use policy, a costed business case and a 90-day plan. Every session ends with something you keep. There are no tests and no marks. No coding experience is needed.

The twelve sessions

No.	Session	You keep
1	Where AI fits in your business	Your completed use-case scorecard and one-page task card
2	How AI works and where it fails	Your reliability page for your own task, and the four controls from today
3	Working with AI tools	Your seven-part brief for your own task, in the Reusable Brief Template, and your plan for checking the result
4	Your information: is your data ready for AI?	Your Information Inventory, your scored readiness scorecard and your top three data gaps
5	Reviewing documents with AI	Your review rules for one kind of document, the check plan with named people, and the Document Review Table to use with them
6	Automation 1: a rule-based workflow	Your workbook page: one task of yours that a rule could route, its rule in one sentence, and the five controls with names filled in
7	Agents and controlled actions	Your boundary table and your Tool Boundary Sheet for one automation, with a named owner, a log and an off switch
8	Automation 2: an AI workflow	Your workbook page: the five questions answered for your own task, and your decision on what you would automate and what stays with a person
9	Your AI use policy	Your Risk Register for the own task and the first draft of your company AI use policy, written from the template
10	Buying and oversight	Your five vendor questions, your oversight card for one tool, and a build, buy or partner choice for your own task
11	The business case	Your costed Business Case Workbook and a one-page Sponsor Briefing, with your go to a pilot, revise or stop decision and the number that decided it
12	Your data roadmap and 90-day plan	Your data roadmap and the follow-up kit (Check-in Form, Results Tracker, Sponsor Briefing), with the dates filled in

What you will be able to do

- Choose AI tasks that are worth doing, safe and easy to check, and measure them against a baseline.
- Brief an AI tool, check what it returns, and know when not to trust it.
- See two automations at work on the same customer messages, one by rules and one with AI and a person checking.
- Set the rules: an AI-use policy, a risk register, and the questions to put to any vendor.
- Write the business case and lead a 90-day plan with named owners.

How we work

Short explanations, one demonstration, then most of the time is yours, working on your own task. Examples come from a fictional company, Nile Valley Foods Ltd, so you never need to share company data in class. Other tools on the market (Power Automate, Make, n8n, agent builders) are compared so that you can choose well, and we build with two.

Before the first session

- Choose three recurring tasks you do or supervise, from any department.
- Bring a laptop and one AI assistant account you already use.
- Have a Google account (a free Gmail account is enough) for the build sessions.
- Use only sample or invented data for practice. Never paste personal or confidential data into a tool you have not approved.

After the course

You receive a follow-up kit. At 30, 60 and 90 days the instructor checks what is running, how much time it saves and what changed in your policy, and you return a one-page check-in form and a results tracker.
