DECEMBER 2026 • ONLY 15 PLACES

Holiday Data and AI Camp

Build practical data and AI foundations before university.

For S.4–S.6 students and vacists. No coding experience needed. Own laptop required. Maximum five learners per group; choose one track.

MACHINE LEARNING

Build and test prediction models.
Tools: Python, Jupyter, NumPy, pandas, scikit-learn.
Your project: model, baseline comparison and test results.

PYTHON FOR DATA ANALYSIS

Turn raw data into clear findings.
Tools: Python, Jupyter, NumPy, pandas, matplotlib, seaborn.
Your project: analysis notebook, charts, cleaning log and report.

WHAT STUDENTS LEAVE WITH

Practical skills: write Python, work with data and check results.
An individual project: something each learner builds, tests and explains.
Presentation experience: a project showcase for parents and guardians.
A completion certificate: awarded for finishing the programme: most classes, a build log and a finished project.
AI literacy: understand how modern AI coding assistants can help—and why you must be able to check, test and explain their answers.

Build a practical foundation for university study in computing, engineering, business, economics, statistics and data science.

HOW THE EIGHT WEEKS WORK

Weeks	Machine Learning	Python for Data Analysis
1–2	Python + guided foundation labs	Python fundamentals in Jupyter
3–4	Data handling + maths/statistics labs	pandas, cleaning and charts
5–6	Regression, classification and evaluation	NumPy, seaborn, merges and result checks
7–8	Individual model, testing, AI literacy & showcase	Individual analysis, AI literacy & showcase

Three core classes weekly. ML adds one foundation lab weekly in weeks 1–4. Other days: project practice. ML: 24 classes + 4 labs. DA: 24 classes.

Jotham Martin Wambi • Main tutor
Data scientist and ML/AI engineer; AI & ML lecturer at IUEA. Master's, Yamaguchi University, Japan; incoming PhD student in Applied Informatics at Osaka Metropolitan University, Japan (April 2027).
linkedin.com/in/jothammartinwambi

Programme fee per learner: UGX 1,000,000 for any group of one to five learners. **Venue:** The National ICT Innovation Hub, Nakawa.

Projects use synthetic sample data. This is a beginner programme, not a professional qualification.

Foundations first: AI coding assistants are introduced only after learners build the core skills themselves.
