Leading with AI: course map for approval

11 November 2026 | 15 sessions of 2 hours | the Leadership Edition, sister of the Executive Edition | nothing is built until this is approved

Who it is for, and the promise

For CEOs, managing directors, board members, directors and senior managers who want to know where AI pays in their industry, at work and for their employees, without the mathematics. Subtitle: Where AI pays in your industry, and how to lead your people through it.

- **Spot value.** Where AI creates value in your industry and your organisation.
- **Ask the right questions.** Of vendors, of your own teams and of every accuracy claim.
- **Judge.** A claim, a pilot, a cost and a risk.
- **Lead people.** Roles, skills, fears and adoption.
- **Start.** A costed, governed 90-day plan and your AI Opportunity Portfolio.

Design rules

- **No mathematics.** No formulas, symbols or algebra on slides or in notes. Counts, percentages and shillings only, as a leader uses them. Every idea is a picture and an everyday analogy.
- **Explain before use.** Every term is explained the first time, in plain words first and then the industry term; when it returns, one line recalls the session where it was built.
- **Sessions build on each other.** Four phases: understand what AI can do, choose and use it, control the risk, lead the change. Each session names what it builds on and what it feeds.
- **Illustration rich.** Every concept slide and every case slide has a purpose-drawn figure: process pictures, icon grids, before and after, value and risk grids, timelines.
- **Real, named cases.** Each session tells named organisations' stories: the problem, what the AI does, the result, the catch. Uganda and East Africa first, then Africa, then global. Every figure carries a source line.
- **Three threads.** Industry (each leader follows their industry), people (one slide every session), and the AI Opportunity Portfolio (it grows every session and becomes the final plan).
- **Same format as the Executive Edition.** 15 sessions of 2 hours, the same brand, build kit, recorded demonstrations, templates and follow-up kit.

How the sessions build on each other

No.	Session	The leader's question	Builds on, and feeds
0	The AI landscape for leaders	What is AI, in plain words, and where is it already at work in my industry?	The start: the vocabulary and the map every later session uses.
1	AI that sees and reads: images, documents and speech	What can AI see or read for us?	Session 0: a model learns from examples. Feeds Session 2: the same learning on your records.
2	AI that predicts from your data	Who will default, churn, buy, fall sick or break down next?	Session 1: learning from labelled examples. Feeds Session 3: every prediction can be wrong.
3	Is it any good? Accuracy claims and the cost of mistakes	How do I judge a vendor who says "95% accurate"?	Session 2: predictions and held-back test cases. Every later tool is judged this way.
4	AI that understands language: sort, search, translate and summarise	What can AI do with our messages, contracts and calls, in English and in local languages?	Sessions 2 and 3: sorting is prediction, judged the same way. Feeds Session 5: from understanding text to writing it.
5	Generative AI: how chatbots write, and why they sometimes invent	Why does a chatbot sound so sure, and when can I trust it?	Session 4: text as meaning. Feeds Session 6: who makes these models and how to choose.
6	The AI market: models, vendors, and buy, rent or build	Which model and supplier, where does our data go, and what will it cost to run?	Session 5: what a chatbot is. Feeds Sessions 7, 8 and 13.

No.	Session	The leader's question	Builds on, and feeds
7	Getting good work from AI assistants: prompting for leaders and teams	How do my staff get reliable work from these tools?	Sessions 5 and 6. Feeds Session 8 and Session 9.
8	Making AI know your business: assistants on your own documents	How does AI answer from our policies, products and files?	Sessions 4 and 7. Feeds Session 9 (what still goes wrong) and Session 14 (data readiness).
9	When AI goes wrong: failures, risk and checking	What can go wrong, what did it cost others, and how do we check?	Sessions 3, 5 and 8. Feeds Session 10 and Session 13.
10	AI agents: delegating work that acts	What may an AI agent do on its own, and who approves?	Sessions 7 and 9. Feeds Session 11.
11	Redesigning work: workflows, value and the business case (practical)	Which tasks change, what is it worth, and when does it pay back?	Sessions 1 to 10: the toolbox. Feeds Session 12.
12	Leading people through AI: roles, skills, adoption and change (practical)	What happens to my employees, and how do I bring them with me?	Session 11: the tasks that change. Feeds Session 13.
13	Governance and buying: policy, risk register and vendors (practical)	What rules, register and vendor checks do we need?	Sessions 6, 9, 10 and 12. Feeds Session 14.
14	Data readiness, AI roadmap and your 90-day plan (practical)	Is our data ready, and what do we do in the next 90 days?	Sessions 8 and 13, and the portfolio. After the course: check-ins at 30, 60 and 90 days.

Phase A: Understand what AI can do

No.	Session	The idea, in pictures	Named cases	Demonstration	Your people	You keep
0	The AI landscape for leaders	AI as a family (rules, machine learning, generative AI, agents). A model learns from examples, like a new employee learning from past files. What AI is good and bad at. The four kinds of job AI does: see and read, predict, understand and write language, act.	Microsoft AI Diffusion H2 2025; McKinsey State of AI 2025; MIT NANDA GenAI Divide; KCB Group (Kenya); Safaricom (Kenya); PlantVillage Nuru; Coca-Cola HBC; Penda Health; Uganda Revenue Authority	The same task done by a rule, a trained model and a chatbot, recorded.	Who in your organisation already uses AI tools, often without telling anyone ("shadow AI").	Your industry chosen for the course, and the first page of your AI Opportunity Portfolio.
1	AI that sees and reads: images, documents and speech	A picture is a grid of dots the machine reads as numbers; it learns from thousands of labelled examples what a diseased leaf, a tumour or a signed form looks like. Reading documents (OCR) and turning speech into text are the same idea. Good at volume and consistency; poor when the new picture differs from the examples.	Makerere AI Lab / mCROPS; Farmers Companion App (Uganda); MASAI trial; Makerere AI Health Lab; One Acre Fund Burundi; Judiciary of Kenya; ULII and Uganda Judiciary; Rio Tinto; Google Health, Thailand MoPH; Uber Eats	A phone photo of a leaf or a receipt read by an assistant, and a handwritten form turned into a table, recorded.	Radiologists, inspectors and data-entry clerks: which tasks shrink, which grow (checking, exceptions).	Portfolio: one place in your organisation where AI could see or read for you.
2	AI that predicts from your data	Prediction learns patterns from past records with known outcomes (who repaid, who left), then scores new cases. Three everyday predictions: a yes or no (will repay), a number (next month's demand), a ranking (whom to call first). Your data decides what it can learn.	Safaricom and NCBA (Kenya); Numida (Uganda); Airtel Money Uganda and GnuGrid CRB; M-KOPA; Apollo Agriculture; Coca-Cola AI suggested orders; Jacaranda Health; Togo Novissi; Gro Intelligence; GE Predix	A model learns from past expense claims which ones to query, recorded, and is tested on claims it has not seen.	Loan officers, planners and sales reps: the score supports the decision; who owns the decision.	Portfolio: one prediction that would change a decision you make.
3	Is it any good? Accuracy claims and the cost of mistakes	Two ways to be wrong: a false alarm and a miss, shown on a row of 100 people icons. Why 95% can be useless when the event is rare. The threshold is a business dial: more catches means more false alarms. Test on cases the system never saw. Bias: when errors fall unevenly on one group.	Epic Sepsis Model; Social Health Authority; Airtel Africa (Uganda, Tanzania, 13 m); Access, GTCO, UBA, Wema (Nigeria); Goldman Sachs / Apple Card (US); Optum Impact Pro; Ofqual; Discovery, GEMS, Medscheme	Move the dial on a recorded invoice-risk model and watch misses turn into false alarms, then price each mistake in shillings.	Who reviews the flagged cases, how much work the false alarms create, and who answers to the customer wrongly flagged.	The vendor question sheet on accuracy, and a "cost of a mistake" line for each portfolio entry.
4	AI that understands language: sort, search, translate and summarise	Four language jobs: sort messages (a prediction, as in Session 2), search by meaning (find the clause even when the words differ), translate, summarise. Meaning as closeness on a map. Local languages have less training text, so quality varies.	Sunbird AI (Uganda); Masakhane (Rest of Africa); Lelapa AI (Rest of Africa); Orange with OpenAI and Meta (West Africa); Jacaranda Health; UK Government (Global); Telstra (Global); Safaricom (Kenya)	Search by meaning: a plain description finds the right contract clause; the same message translated to Luganda and back, recorded.	Contact-centre agents and records staff: from reading everything to handling what the system routes to them.	Portfolio: one pile of text in your organisation worth sorting, searching or translating.
5	Generative AI: how chatbots write, and why they sometimes invent	A chatbot writes one word at a time, choosing a likely next word, like phone autocomplete trained on a library. Fluent is not the same as true: nothing inside checks the facts. Where it shines (drafts, summaries, first answers) and where it invents (citations, figures, policies).	Penda Health; Edo State, Nigeria; Digital Green Farmer.Chat; Mata v Avianca; Air Canada; DPD; Coca-Cola AI Christmas ad; Klarna (Sweden)	The same question asked twice gives two answers; a request for references produces one that does not exist, recorded.	Every knowledge worker drafts with it; the new skill is checking. Who signs what the machine drafted.	Five questions to ask of any chatbot answer; portfolio: one drafting task to hand to an assistant.

Phase B: Choose it and use it well

No.	Session	The idea, in pictures	Named cases	Demonstration	Your people	You keep
6	The AI market: models, vendors, and buy, rent or build	Who makes the models (global labs, open models, African-language models). Three routes: rent a hosted assistant, host an open model, or build on a partner's platform. What decides: data location and the law, cost per use, lock-in, the vendor surviving. Benchmarks describe their own tests, not your work.	Orange with OpenAI and Meta (West Africa); Vodacom Group and Google Cloud (South Africa); Cassava Technologies and Nvidia (Rest of Africa); Microsoft and G42 (Kenya); Jacaranda Health (Kenya); Babyl / Babylon Health; Uganda PDPO v Google LLC; PwC + OpenAI; Kenya Airways	One task, two assistants, scored on five checks, recorded.	IT, procurement and legal at one table; who owns the vendor relationship.	A rent, host or build decision sheet; portfolio: the route for each entry.
7	Getting good work from AI assistants: prompting for leaders and teams	A prompt is a brief to a new colleague: role, context, examples, format, limits. Test prompts on a small set of real tasks before trusting them. Reasoning models think longer for harder tasks. The "jagged frontier": excellent on some tasks, worse than staff on others.	NBER customer support study; BCG/Harvard jagged frontier; P&G field experiment; UK Government Copilot trial; Absa Group (Rest of Africa); Equity Group (Kenya); Nestlé NesGPT; Microsoft Work Trend Index 2024	A weak and a strong brief on the same sales data, recorded; the strong one taken apart.	The biggest gains go to newer staff; training, shared prompt libraries and permission to use approved tools.	A reusable brief template and a prompt log; portfolio: one team task with its tested brief.
8	Making AI know your business: assistants on your own documents	An open-book exam: the assistant first finds the right pages (search by meaning, Session 4), then answers from them and shows the source. When the documents are messy, the answers are too. Long documents can be pasted; customising a model teaches style, not facts.	Morgan Stanley Wealth Management (US); Telstra (Global); McKinsey (Global); Allen & Overy + Harvey; Standard Bank (Rest of Africa); Kisan e-Mitra, Govt of India; Bank of America (US); Octopus Energy	The same staff-handbook questions answered with no document, with the right pages, and with the whole handbook, recorded and scored.	The keepers of knowledge (HR, compliance, product) become owners of the source documents.	Prompt, retrieve or customise: a one-page decision; portfolio: one knowledge assistant and its documents.

Phase C: Control the risk

No.	Session	The idea, in pictures	Named cases	Demonstration	Your people	You keep
9	When AI goes wrong: failures, risk and checking	Five ways AI fails: it invents, it misses the right source, it repeats bias, it obeys hidden instructions, it drifts as things change. The organisation is liable for what its AI says. A ten-question test set and a five-step check before trust. Expected cost of an error: how likely times how costly.	Dutch Tax Administration; Deloitte Australia; Commonwealth Bank of Australia; McDonald's + IBM; Mulla Pride (Kenya); Uganda PDPO v Google LLC; Uganda first DPPA criminal conviction; Safaricom, NCBA, KCB (Kenya); Uganda national ID; UnitedHealth / naviHealth	Recorded failure cases checked against an answer key, then scored.	Accountability: a named owner for every AI use, and a culture where staff report AI errors.	A five-step check routine and a test-set template; portfolio: the worst failure for each entry.
10	AI agents: delegating work that acts	An agent is a chatbot with tools and a loop: plan, act, check, repeat. Delegation like a house-sitter with only the keys you give. Levels of freedom, least privilege, human approval before anything that cannot be undone, a log and an off switch. Hidden instructions in emails and documents.	Octopus Energy; South African Revenue Service; Heidelberg Materials + Carbon Re; Capitec Bank (South Africa); Jumia; Centenary Group and Huawei (Uganda); Lemonade; Robodebt; Gartner	Recorded runs: an assistant meets a hidden instruction in a supplier email and refuses; drafts kept to written rules.	Supervising agents is a new management job: who approves, who audits the log.	A tool boundary sheet; portfolio: the level of freedom for each entry.

Phase D: Lead the change in your organisation (practicals)

No.	Session	The idea, in pictures	Named cases	Demonstration	Your people	You keep
11	Redesigning work: workflows, value and the business case (practical)	Map a workflow (trigger, steps, handoffs, check). For each step: a rule, an AI step, an agent or a person. Value in time, errors avoided and revenue; payback and return in shillings. Score the portfolio on value and feasibility.	Coca-Cola AI suggested orders; Unilever + Accenture digital twins; Shell + C3 AI; Uganda Revenue Authority; Georgia State University; MIT NANDA GenAI Divide; PwC / Google Cloud; Gartner	The same twelve customer messages handled by a rule and by AI, recorded; the business case worked for Nile Valley Foods.	Which roles each redesigned workflow touches, and how many hours move to which work.	A mapped workflow, a costed business case and the scored portfolio.
12	Leading people through AI: roles, skills, adoption and change (practical)	Tasks change before jobs do. Exposure is not loss: augment, automate, or create. The adoption curve and the frontline stall. Fears to address (jobs, surveillance, blame). Skills by level: everyone, power users, builders, leaders. Communicating the why, what is approved and what is not.	WEF Future of Jobs 2025; IMF job exposure; ILO GenAI exposure index; DBS Bank (Singapore); BT Group (UK); Commonwealth Bank of Australia; Duolingo "AI-first" memo; Equity Group (Kenya); BCG AI at Work 2025; Microsoft AI skilling pledges, Kenya and Nigeria	A role redesigned task by task for one Nile Valley Foods job, worked live.	The whole session: a people plan with roles, skills, communication and champions.	A people and skills plan, and the employee briefing for your first AI use.
13	Governance and buying: policy, risk register and vendors (practical)	An acceptable use policy (better than a ban), a risk register (likelihood times impact, as in Sessions 9 and 10), data classification, the law in Uganda and beyond, and vendor due diligence with total cost of ownership.	Uganda DPPA 2019; Uganda PDPO v Google LLC; Uganda national AI strategy; AU Continental AI Strategy; EU AI Act timeline + 2026 Digital Omnibus; ISO/IEC 42001; NIST AI RMF; Bank of Uganda; Kenya Airways; Kenya Judiciary draft AI policy; Kenya ODPC penalty notices; Nigeria NDPC	A vendor proposal reviewed with AI help, recorded, and the red flags you still check yourself.	Who owns AI governance; training staff on the policy; a board briefing.	AI use policy draft, risk register, vendor question list.
14	Data readiness, AI roadmap and your 90-day plan (practical)	Five kinds of data, a data inventory, quality checks, a readiness scorecard, then a roadmap with owners, dates and success measures, and check-ins at 30, 60 and 90 days. The final AI Opportunity Portfolio.	Vodacom Group and Google Cloud (South Africa); Uganda Revenue Authority; Uganda MoICT&NG; Uganda National Data Strategy; Dimitra + NACCU coffee; AB InBev BEES / Nile Breweries; Gartner; GSMA AI for Africa use cases	A script counts the data faults in the Nile Valley Foods files, recorded; the scorecard worked.	Data owners named; the sponsor and the team for the first 90 days.	Inventory, scorecard, roadmap, 90-day plan, the final portfolio and the follow-up kit.

Every session from 1 to 10 has the same shape

- **Recall and hook (10 min).** Last session in one picture, then today's question opened with a real case.
- **The idea (25 min).** Everyday picture, what the AI takes in and gives out, how it works in plain words with a drawing, what it is good and bad at. One idea per slide.
- **Industry tour (15 min).** One picture with the six main industries and today's idea in each, then two or three named cases, one slide each.
- **Demonstration (15 min).** Live or recorded, labelled with the model, the date and the number of runs.
- **Break (5 min).**
- **Hands-on (25 min).** Add one or two entries to your AI Opportunity Portfolio using today's idea.
- **Your people and your decision (15 min).** Roles, tasks, skills and fears; what you would do.
- **Close (10 min).** Take-away sheet and the bridge to next time.

Practicals (11 to 14): 10 recall, 20 idea with cases, 10 demonstration or worked example, 5 break, 60 the leader works on their own organisation, 10 decision, 5 close.

Industry balance: named cases per session

Industry	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	All
Banking and microfinance	1		1	2		1		1	2	2	1		3	1		15
Telecom and mobile money	1		2	1	2		2			1			1		1	11
Agriculture and agribusiness	1	2	2			1			1						1	8
Manufacturing and FMCG	1		2			1		2			1	2			1	10
Healthcare and insurance	1	3	1	4	1	1	1			1	1					14
Public sector	1	1	1	1				1		2	2	1			1	11
Energy and mining		1	1						1		1	1				5
Retail and logistics		1				2	1			1	1			1		7
Education						1						1				2
Legal and professional services						1	1		1	1				1		5
People (cross-industry)								3					6			9
Adoption (cross-industry)	3										1	3			2	9
Governance and law										1				9	1	11
Search, language models, Uganda		2			5		4	1	3	1	1				1	18

The industry tour slide in every session covers all six main industries; the counts above are the cases told in depth. Search, language-model and Uganda cases (GAP) include Sunbird AI, Makerere AI Lab and AirQo, ULII and the Judiciary, the Data Protection Office, Centenary Group and MTN MoMo Uganda.

The evidence base

164 named cases, researched on 11 November 2026 from pages actually read, each with its source, date and confidence (High or Medium; weaker ones were dropped). They are in 05 Course Maintenance/Build/research/. Rules for teaching them:

- Every figure on a slide has a source line; company claims are said to be company claims.
- Failures and mixed results are taught as well as successes (for example Gro Intelligence, GE Predix, Air Canada, the Dutch childcare benefits scandal, Commonwealth Bank of Australia, Babyl Rwanda, Kenya SHA).
- Figures are re-checked in the week a session is taught; the regulatory status (Uganda's national AI strategy, the EU AI Act dates) especially.

Honest gaps found: no published, measured AI result yet for a named Ugandan bank, telecom or government agency (Ugandan cases are pilots, partnerships, research or regulation); Uganda's national AI strategy is still a draft awaiting Cabinet (re-checked 11 November 2026); few African cases publish false-alarm rates. The course says so where it matters.

What the leader takes home

- A one-page take-away sheet from every session.
- The AI Opportunity Portfolio: candidate uses in your organisation, scored for value and feasibility, with people impact, risk and data readiness.
- From the practicals: a mapped workflow and business case, a people and skills plan, an AI use policy draft, a risk register, a vendor question list, a data inventory and scorecard, a roadmap and a 90-day plan, and the 30, 60 and 90-day follow-up kit.
- New learner documents: the Industry Use-Case Atlas (uses and named cases by industry) and the Questions to Ask sheet (for vendors, IT and the board). The Executive Edition's Formula Sheet is not part of this edition.

How it will be built after approval

- **Pilot.** Sessions 0 and 2 built in full (decks, notes, figures, take-aways) for your review: Session 0 sets the map and the threads, Session 2 shows the pattern of a concept session with its industry tour.
- **Then the rest.** Sessions 1 and 3 to 14 in parallel, followed by a coherence pass across all fifteen, like the one done for the Executive Edition.
- **Then the documents.** Handbook, workbook, take-away sheets, facilitator guide, presenter script, Industry Use-Case Atlas and Questions to Ask.
