Industry Use-Case Atlas

Leading with AI. 164 named, sourced cases by industry: what the AI does, the result, its limits, and the sessions that teach it. Researched 11 November 2026.

How to read this atlas

Each case names a real organisation. Figures are quoted as the source states them; many are the company's own claims, and the Limits column says so. Check a figure again before you quote it in your organisation.

Sessions: where the case is taught in the course. Cases with no session are extra reading for your industry.

Full blocks with links, confidence and cautions are in 05 Course Maintenance/Build/research.

Banking and microfinance (14 cases)

Case	What the AI does	Result	Limits and source	Sessions
Equity Group: mandatory GenAI training for the whole workforce	Equity says it is building AI into customer engagement, risk management and operations, moving from an IT-led model to AI inside core functions. It made AI upskilling mandatory for staff in every role.	Over 7,300 employees trained and certified in generative AI through the Huawei ICT Academy, "over 62 percent" of an 11,900-strong workforce. 53 staff enrolled in a financial engineering master's at WorldQuant University. The plan is to scale advanced AI training to up to 5,000 staff "over time". 98.2% of transactions happen outside branches (period not ...	These are training counts, not productivity results. Certification by a vendor academy (Huawei) is not the same as measured skill. Check Equity's FY2025 integrated report before quoting. Source: "Equity Group Bets on AI to Power Growth as Digital Transactions Hit 98.2%", TechTrends Kenya, 25 Mar 2026.	7, 12
KCB Group: data-driven scoring behind mobile lending	KCB uses credit-scoring and behavioural-scoring models to decide who gets a mobile loan and how much, and reviews limits every two months. It added PesaLink transaction data and Hustler Fund repayment data to widen the pool of pre-scored customers.	Mobile lending of Sh544 billion in 2025, up 30% year on year. Average disbursement of Sh1.5 billion a day. Credit eligibility up 7% and overall limits up 17% year on year from "enhanced scoring frameworks". Nearly 8 in 10 Kenyan loans are disbursed digitally (CBK figure, period not given). No default or NPL figure was published in the article.	The article says "data analytics" and "scoring models", not "AI". Present it as prediction from data (S2). There is no figure on loan quality, so growth in lending is not evidence that the scoring is accurate. Source: "KCB rides on data to disburse digital loans worth Sh1.5 billion daily", The Star (Kenya), 7 May 2026.	0, 14
Numida: credit scoring for Ugandan micro-businesses without scraping phones	Numida scores small businesses with its own model, built from its loan history and business profiles (sector, cash flow, repayment behaviour), using only what the customer enters in the app. Repeat clients in good standing are approved instantly. New or larger requests can take up to 24 hours.	$20 million of working capital lent to micro and small businesses to date (Sept 2022). Monthly lending grew from $250,000 to $2 million. Loans of $100 to $5,000, due after one month, at 10% to 16% interest (average about 11.5%). No repayment or default rates were published.	The figures date from 2022 fundraising coverage. Its current status was not checked. A useful teaching contrast with BNK-05 and BNK-06: the CEO said Numida does not scrape phone contacts or social media. Source: "YC-backed fintech Numida raises $12.3M led by Serena Ventures to extend loans to MSMEs beyond Uganda", TechCrunch, 28 Sep 2022.	2
Bank of Uganda: building an AI governance framework	The governor said the Bank is developing a "Comprehensive AI Governance Framework" requiring fairness, transparency, accountability, validation and central human oversight. Its Research and Policy Directorate already uses machine-learning models to refine GDP and inflation forecasts.	No published result. Initiatives named: a Financial Inclusion Data Dashboard with gender-disaggregated insights, and staff training in Power BI, Python, R and Azure through communities of practice and partners (IMF, FSD Uganda, universities). The governor warned of herding, dependence on a few technology firms, and algorithmic bias.	The framework was in development when he spoke. Check whether it has been issued before saying it is in force. Global statistics in the speech (for example, a 20% to 30% cut in false-positive reports) are general, not Bank of Uganda results. Source: Michael Atingi-Ego, Governor, Bank of Uganda, address to the 2025 Data Analytics, AI and Data Governance Symposium, Kampala, 11 Nov 2025, published by the Bank ...	13
Mulla Pride (KeCredit, Faircash): Kenya data regulator fines a digital lender	The lender got borrowers' contacts' names and details from third parties and used them to send intimidating messages and make threatening calls to recover debts. Kenya's Office of the Data Protection Commissioner (ODPC) fined it.	Fine of Sh2,975,000 (about $20,000 per TechCabal headline coverage), 26 Sep 2023.	This is a data-protection and debt-collection failure, not a model failure. Use it to show that data-hungry lending apps create legal risk regardless of how good the score is. Context: CBK licensed 110 new digital credit providers in 2025 (85 to 195), and ... Source: "Mobile lender fined millions for breach of borrowers' privacy", The Star (Kenya), 26 Sep 2023. Corroborating headline: "Digital lenders fined in Kenya", ...	9

Case	What the AI does	Result	Limits and source	Sessions
Soko Lending (SokoLoan): Nigeria's data regulator fines a loan app	The loan app required access to borrowers' phone contacts. When a borrower missed a repayment, it allegedly sent privacy-invading messages to the borrower's contacts.	NITDA fine of ₦10 million (Aug 2021). Other sanctions: no more such messages until it complies with the NDPR, a paid Data Protection Impact Assessment, nine months of mandatory oversight, and referral of criminal aspects to the Nigeria Police. Findings included sharing data without a lawful basis and embedding trackers that sent data to third parties ...	The regulator was NITDA, not the FCCPC or today's NDPC. The case is from 2021. Source: "NITDA imposes N10 million fine on Soko Loan for data privacy invasion", ICIR Nigeria, 17 Aug 2021. Also reported by TechCabal, 24 Aug 2021 (not read).	
Capitec: AI fraud blocking while headcount still grows	AI scores payments and beneficiaries to block scams and mule accounts before money leaves. Separately, staff use AI tools daily, an in-house tool (Capitec Pulse AI) gives contact-centre agents real-time client information, and an AI agent sits inside business-banking credit processing.	In the year reported: more than 131,000 fraudulent beneficiaries blocked, more than 394,000 scam payments prevented, about R673 million in potential client losses avoided. About 5,000 employees have AI tools, averaging four interactions a day each. Total staff rose by 711, from 16,525 to 17,236 (+4.3%).	"Losses avoided" is the bank's own estimate. The number of legitimate payments wrongly blocked (false alarms) is not published, which makes this a good S3 discussion. Source: "Capitec bets big on AI and keeps hiring", TechCentral, 22 Apr 2026 (reporting Capitec's annual results).	10, 11
Access, GTCO, UBA and Wema: fraud prevented, but AI's share is not isolated	The banks use real-time fraud monitoring, device detection, liveness checks and authentication. Regulators are pushing them towards AI-based monitoring.	In 2025 the four banks faced about N17.5bn of attempted or involved fraud and blocked or recovered about N14.5bn. Access, GTCO and UBA lost N2.13bn of N10.29bn (20.66%). Wema blocked about 88% of attempts, but its losses rose to N847.6m from N29.45m in 2024. Access, GTCO and UBA together spent N280.90bn (about $206m) on technology in 2025.	The article credits "detection and response systems" in general. It does not say how much is due to AI. Use it to teach executives to ask "what did the AI add, against what baseline?" Wema's rising losses show that a high block rate can sit beside rising ... Source: "How tech spend helps four banks block N14.5bn fraud losses in 2025", BusinessDay (Nigeria), 12 May 2026.	13, 14
Commonwealth Bank of Australia: 45 call-centre jobs cut for a voice bot, then reinstated	CBA declared 45 customer-service roles redundant after bringing in an AI voice bot for simple inbound queries. The Finance Sector Union said call volumes were actually rising, with overtime offered and team leaders answering calls. CBA reversed the decision and apologised.	The bank said its initial assessment "did not adequately consider all relevant business considerations" and that "this error meant the roles were not redundant". The 45 staff could keep their role, move to another role, or take redundancy (per the union). No measured result for the bot was published in the sources read.	Other reports say CBA claimed the bot cut calls by 2,000 a week. That figure was not on the pages read, so do not quote it. Some outlets call the tool a chatbot, others a voice bot. Source: "Bank reverses decision to replace 45 customer service staff with AI chatbot", The Register, 22 Aug 2025. "CBA reverses AI-driven job cuts, admits 'error'", ...	9, 12
Klarna: AI assistant "did the work of 700 agents", then humans were rehired	An OpenAI-powered assistant handled customer chats about refunds, returns and payments in more than 35 languages.	Klarna's February 2024 claim: the assistant handled 75% of customer chats, about 2.3 million conversations, in its first month, the work of 700 agents. In May 2025 the CEO said the AI output was cheaper but of "lower quality", and Klarna began rehiring human agents (remote roles) after a hiring freeze of more than a year.	The "700 agents" figure was a company claim and was never independently checked. Klarna is a fintech, not a deposit-taking East African bank. Use it as a global benchmark for counting chats handled rather than resolution quality. Source: "Klarna Is Hiring Customer Service Agents After AI Couldn't Cut It on Calls, According to the Company's CEO", Entrepreneur, 9 May 2025 (reporting a Bloomberg ...	5, 12
DBS Bank: 4,000 contract roles expected to go as AI takes over work	The CEO said AI would take over work currently done by people on project-based contract roles.	About 4,000 temporary and contract jobs to be cut over three years across 19 markets through natural attrition. Permanent staff were not affected. About 1,000 new AI-related jobs were expected (announced 24 Feb 2025).	This is a forecast, not a completed outcome. Check progress before teaching. Source: "DBS set to cut 4,000 temporary jobs over 3 years due to AI, CEO says", Reuters via Yahoo Finance, 24 Feb 2025. Also reported by Bloomberg, 24 Feb 2025 (not ...	12

Case	What the AI does	Result	Limits and source	Sessions
Morgan Stanley Wealth Management: an assistant grounded in the firm's own research	"AI @ Morgan Stanley Assistant" (OpenAI-powered, fully rolled out September 2023) lets advisers ask questions of the firm's own intellectual capital. "Debrief" takes meeting notes with client consent, summarises them, drafts a follow-up email for the adviser to review, and saves a note to ...	98% of financial-adviser teams had adopted the Assistant (June 2024, company figure). One adviser said Debrief saved him about half an hour per meeting (anecdote). No firm-wide productivity figure was published.	"Adopted" is not defined. Time saved is one adviser's anecdote. Source: "Morgan Stanley Wealth Management Announces Latest Game Changing Addition to Suite of GenAI Tools", Morgan Stanley press release (Business Wire), republished ...	8
Apple Card and Goldman Sachs: the gender-bias investigation	After viral complaints in 2019 that the card's algorithm gave women lower credit limits, the New York Department of Financial Services (NYDFS) investigated the underwriting.	NYDFS analysed underwriting data for about 400,000 New York applicants and found no intentional discrimination and no disparate impact (23 Mar 2021). It criticised "deficiencies in customer service and a perceived lack of transparency" that undermined trust. Goldman and Apple improved transparency and dropped a rule that made approved applicants wait six ...	The algorithm was cleared. The lesson is that failing to explain a decision did the reputational damage, not proven bias. Source: "Goldman cleared of bias claims in NYDFS's Apple Card probe", Banking Dive, 24 Mar 2021.	3
Bank of America: Erica for clients and for employees	Erica is a virtual assistant in the bank's app that answers client questions and sends proactive insights on spending and saving. "Erica for Employees" answers staff questions, including IT help.	Over 3 billion client interactions since 2018, nearly 50 million users, more than 58 million interactions a month on average. Over 98% of users say they find the information they need (company survey). Erica for Employees is used by over 90% of employees and cut calls to the IT service desk by 50%.	Company figures. Erica was built over seven years with scripted responses (over 700) as well as AI, so it is not an overnight GenAI rollout. Source: "A Decade of AI Innovation: BofA's Virtual Assistant Erica Surpasses 3 Billion Client Interactions", Bank of America press release (republished), 20 Aug 2025.	8

Case	What the AI does	Result	Limits and source	Sessions
M-Shwari: lending decisions from phone and M-Pesa history	The bank scores applicants using their Safaricom phone and M-Pesa usage history to judge creditworthiness, set individual limits and lend to first-time applicants. Later versions also used customers' M-Shwari savings and repayment records.	Over 10 million accounts and 4.5 million active customers. 20.6 million loans worth $277 million to 2.8 million unique borrowers since November 2012, average loan $15. 50,000 loans disbursed per day. Non-performing loans (over 90 days): 2%. Fee: 7.5% per 30-day loan.	The figures are from 2015. Present it as the founding case, not today's numbers. Pair it with TEL-02 for the harms side. Source: Tamara Cook and Claudia McKay, "Top 10 Things to Know About M-Shwari", CGAP, 2 Apr 2015.	2
Fuliza and digital credit: late repayment, blacklisting and a forced reset	Algorithmically scored mobile credit spread fast. Surveys found many borrowers repaid late or defaulted, and millions of Kenyans were negatively listed at credit bureaus. In 2022 the President announced that 4 to 5 million Kenyans would be removed from credit-bureau blacklisting, and Fuliza cut ...	CGAP and FSD Kenya phone surveys of over 7,000 mobile users: 47% of Kenyan and 56% of Tanzanian digital borrowers had repaid a loan late; 12% (Kenya) and 31% (Tanzania) had defaulted; 20% of Kenyan borrowers had cut food purchases to repay (CEGA, Dec 2018). Fuliza (Sept 2022): 28 million customers opted in. Ksh290 billion disbursed in six months to June ...	The survey covers digital loans in general, not only Fuliza or M-Shwari. The delisting was a political announcement, not a court or regulator ruling. Present it as a cost of the speed of automated credit, not as proof the models were wrong. Source: "Where are we now? 6 years after the first digital consumer credit product launched", CEGA (UC Berkeley), Dec 2018. "4 million names to be delisted from CRB ...	2, 9
Safaricom: AI monitoring of M-Pesa finds laundering through betting firms	Real-time transaction monitoring and machine-learning models flag unusual patterns across millions of M-Pesa transactions a day for anti-money-laundering, fraud and sanctions checks.	Detected money laundering through betting platforms, flagged suspicious international transfers, found inflated agent deposits totalling 1.7 billion shillings, and reported payments linked to 14 wildlife poachers to the Financial Reporting Centre. Context: M-Pesa processes over 37 billion transactions a year worth 38.3 trillion shillings, with 35.8 million ...	No false-positive rate or detection rate is published. An "89% accuracy" figure circulates online without a traceable source: do not use it. Source: "Kenya: Safaricom's AI uncovers money laundering schemes in betting firms on M-Pesa", iGamingToday, 21 Oct 2025. TechCabal reported the same, 10 Oct 2025 ...	0, 2, 4, 11, 14
Safaricom Zuri and credit algorithms challenged in the High Court	In April 2026, petitions were filed in Kenya's High Court challenging Safaricom's use of AI. One petition (reported by HapaKenya) says customers are trapped in loops with the Zuri chatbot without an easy route to a human, and that Fuliza and M-Shwari limits are set by "black box" algorithms that ...	No ruling as of the sources read. Orders sought: a forensic audit of Safaricom's AI systems and a temporary injunction on automated decision-making until a regulatory framework exists.	These are allegations, not findings. HapaKenya names the petitioner as Benedict Kabugi Ndung'u, while search summaries of The Standard name a different person, so there may be two petitions. Do not name individuals in class. Check the docket for outcomes ... Source: "Safaricom sued for violating consumer rights in their use of AI in their business", HapaKenya, 24 Apr 2026. "Safaricom's Zuri on trial: Man in court over use ...	0, 2, 4, 11, 14
Airtel Africa: AI spam alert against SMS scams	A network-level system scores incoming SMS on more than 250 real-time signals (sender behaviour, patterns, local scam trends) and labels suspicious messages "SPAM ALERT" before the customer opens them. Airtel says it does not read or store message content. It costs customers nothing and needs no ...	Uganda launch 16 Apr 2025. Uganda context from the regulator (UCC): over 60% of mobile users receive potentially fraudulent messages weekly, and mobile scams cost Ugandans an estimated UGX 23 billion in 2024. Tanzania: fraud cases reported on Airtel's network fell from 5,876 (March 2025) to under 2,600 (June 2025), about 56%, per TCRA data. Over the same ...	The 56% fall is a before-and-after comparison, not proof the AI caused it. TTCL fell slightly more without it. A strong S3 teaching case. Airtel's group-wide "205 million spam SMS flagged" figure was seen only in search results, not on a page read: do not ... Source: "How Airtel Uganda's new AI-powered spam alert service works", Techjaja, Apr 2025. "AI tool helps Airtel slash fraud cases by 56 percent", The Citizen ...	2, 3, 10

Case	What the AI does	Result	Limits and source	Sessions
Airtel Money Uganda and GnuGrid CRB: a credit score from mobile-money data	It gives lenders a quick credit score for any Airtel Money customer, built from mobile-money data that banks do not have. It replaces a slow manual credit check.	Launched 24 Jan 2024. Draws on data from 14 million Airtel Money wallets. No published result on approvals or defaults. Follow-on (reported, not read in full): Letshego's LetsGo Pesa loan (Sept 2024) uses the score.	This is a launch announcement. Some outlets say Bank of Uganda and UMRA guided it, but the page read named only the Ministry of Finance, so do not claim regulator approval. Source: "Airtel and GnuGrid CRB launch Uganda's first mobile credit score for swift and inclusive financial assessment", TechAfrica News, 24 Jan 2024.	2, 3, 10
MTN Ghana: machine learning against MoMo fraud	MTN says it uses machine learning, AI and predictive tools to flag suspicious MoMo activity, alongside biometric app login, extra one-time passwords for bank-to-wallet transfers, and device binding. Operators are discussing a shared, cross-network fraud-monitoring unit.	No published fraud result. Scale: about 8.4 billion transactions processed, about 23 million a day.	MTN Uganda has made similar statements (Daily Monitor, 2026, blocked to automated reading). A widely quoted "85% fraud reduction" in Uganda came from awareness campaigns, not AI: do not attribute it to AI. Source: "MTN enhances MoMo security as daily transactions hit 23 million", MyJoyOnline, 3 Aug 2026.	
JUMO: credit scoring for telco customers across Africa	JUMO uses mobile-operator data, with user permission, to build credit scores and loan products for people with no bank record, collateral or credit history. Telcos distribute the loans through their mobile-money wallets.	Over US$6 billion lent to more than 25 million customers and small businesses (March 2024, company figure). "Almost doing a loan per second" (President Joe Mucheru).	No default or pricing outcomes are published. Later figures ($8 billion to 31 million users) appear in search results but were not read. Source: "Interview: JUMO's Joe Mucheru on AI's role in fintech", Connecting Africa, 28 Mar 2024.	
Orange with OpenAI and Meta: AI in Wolof and Pulaar	Orange is fine-tuning OpenAI's Whisper speech model and Meta's Llama models on Wolof and Pulaar, starting in 2025, so customers can talk to Orange support and sales in their own language. The fine-tuned models are to be offered under a non-commercial licence for uses such as public health and ...	No published result (announcement). A separate deal gives Orange access to OpenAI models hosted and processed in European data centres.	Plans only. Check whether models shipped before teaching. Speaker counts (about 16 million Wolof, 6 million Pulaar) appear in Orange's release but were not on the page read. Source: "Orange to bridge AI language divide in Africa with OpenAI and Meta", Capacity, 27 Nov 2024. Orange's own press release (orange.com, Nov 2024) exists but ...	1, 4, 6
Vodacom Group and Google Cloud: data platform first, then AI	A multi-year deal moves and unifies Vodacom's data platforms onto Google Cloud (BigQuery), then applies Vertex AI and Gemini models to network optimisation, personalised customer care, machine-learning fraud detection and new fintech services.	No published result (announcement, 25 Nov 2025). Scale: over 223.2 million customers, 93.7 million financial-services users, $460 billion of mobile money processed a year.	Vendor announcement. The release says nothing about data residency or staff training, which is a good discussion point for S7. Source: "Vodacom Announces Multi-Year Strategic Collaboration with Google Cloud to Boost Africa's AI Advancement", Google Cloud press release, 25 Nov 2025.	5, 6, 14
BT Group: up to 55,000 job cuts, about 10,000 to AI	BT said automation and AI, especially in customer service, would replace about 10,000 roles, alongside cuts from finishing its fibre build.	Plan to cut up to 55,000 roles (more than 40% of about 130,000 staff, including contractors) by 2030, to 75,000 to 90,000. About 10,000 of these to be replaced by AI (announced 18 May 2023). Unions: Prospect was "deeply concerned"; the CWU wanted cuts to come first from subcontractors and natural attrition.	A plan, not an outcome. The figure dates from 2023. Source: "BT to axe up to 55,000 jobs by 2030 as it pushes into AI", The Guardian via Yahoo Finance, 18 May 2023. Also widely reported by Reuters and others.	
Lingo Telecom: $1 million FCC penalty for carrying AI deepfake robocalls	Two days before New Hampshire's January 2024 primary, robocalls with an AI-cloned voice of President Biden told voters not to vote. Lingo did not create the audio but carried the calls, with spoofed numbers.	Lingo agreed to pay $1 million and accept stricter oversight (21 Aug 2024). The political consultant behind the calls faced a separate proposed $6 million FCC fine.	The specific rule breached (caller-ID authentication) appears in other coverage but not on the page read. Source: "Telecom company agrees to $1 million fine over Biden deepfake", NBC News, 21 Aug 2024. Also reported by CyberScoop and RCR Wireless (not read).	

Agriculture and agribusiness (13 cases)

Case	What the AI does	Result	Limits and source	Sessions
PlantVillage Nuru (cassava disease app)	A farmer or extension worker points a phone camera at cassava leaves, and the app names the disease and gives advice. It works offline.	The peer-reviewed abstract reports that Nuru was 74 to 88% accurate when it examined six leaves per plant. That was similar to cassava experts and better than extension agents (40 to 58%) and farmers (18 to 31%). Accuracy on a single leaf was much lower: 49% overall in the field, and 21% for cassava brown streak disease. In an image test, the 2020 model ...	The abstract and the results tables give slightly different figures, so quote the abstract range and say the figures are from 2020. A 2020 Kenyan press article claimed "up to 98%" accuracy. Do not use that figure. This is a good S3 lesson: the headline ... Source: Mrisho L.M. et al., "Accuracy of a Smartphone-Based Object Detection Model, PlantVillage Nuru, in Identifying the Foliar Symptoms of the Viral Diseases of ...	0, 1, 3
Makerere AI Lab cassava diagnosis (mCROPS)	A smartphone app reads a photo of a cassava plant and classifies it as healthy or as having one of the main cassava diseases, with an estimate of severity. Farmers and extension workers also uploaded geotagged photos, so researchers could map where disease was spreading.	No published farm-level result. Mwebaze reports about 400 downloads of the published base model, and that leaf spectral data detected disease about six weeks earlier than images.	Research project, not a commercial service. The current status of the app is unknown. Use it for the lessons, not for outcomes. Source: "Interview with Ernest Mwebaze: a machine learning-based app for diagnosing plant diseases", AIhub, 16 Mar 2023. (accessed 11 Nov 2026).	1, 14
Apollo Agriculture (input credit for smallholders)	It uses satellite images of farms and machine learning to decide which smallholders get seed and fertiliser on credit, repaid after harvest. Field agents sign farmers up, and approved farmers receive a voucher code by text message.	About 100,000 farmers were served by the end of 2021, through more than 1,000 retailers and 5,000 agents (TechCrunch, March 2022). In June 2021 the company said it served 60,000 farmers. No repayment or default rate is published in these sources.	Farmer numbers are company claims, and they come from funding announcements. A GSMA case study exists but could not be opened (access blocked), so its figures are not used here. Source: "Kenya-based agritech Apollo raises $40 million in SoftBank-led round...", TechCrunch, 21 Mar 2022. (accessed 11 Nov 2026). "Kenyan agritech Apollo... $1 ...	2
Digital Green Farmer.Chat (GenAI advisory chatbot)	A chatbot answers farmers' and extension workers' questions by text, voice or photo, in local languages. It draws its answers only from a vetted library of farming content (retrieval-augmented generation).	In the 2024 paper, more than 15,000 users had asked more than 300,000 questions. Kenya had the most use: 8,805 users and 225,500 questions. The system answered about 75% of questions. About 80% of answers were rated highly faithful to the source content and 67% highly relevant. The average response took 9 seconds. By 2026 Digital Green reported more than ...	The paper's country figures do not add up exactly to its headline totals. The "one million farmers" figure is Digital Green's own. IFPRI's formal evaluation (2025 to 2027) was not yet published at the time of research. Reported problems: data costs, low ... Gro Intelligence (failure)	It combined data from governments, weather agencies and markets into AI forecasts of crop yields, climate risk and food supply, which it sold to multinationals and governments.	It shut down in June 2024 after failing to raise new financing. It had raised over $125 million in about ten years, including an $85 million round in 2021, and its valuation reportedly fell from $850 million to under $25 million. The founder-CEO was replaced in February 2024, and 60% of staff were laid off in March 2024. A former employee described a ...	The SEC inquiry was reported from unnamed sources, and the SEC would not confirm it. Say "reported", never "found". Do not suggest fraud. Source: Onukwue A., "A Kenyan agri-data startup tipped to underpin global food security shuts down", Semafor, 4 Jun 2024. "Ag insights platform Gro Intelligence is ...	2
Dimitra and NACCU (coffee traceability for EU deforestation rules)	Farmers register their plots on a phone app with GPS mapping, and the platform checks the deforestation risk and produces the compliance report that EU buyers require. It is described as "AI-powered" and works offline in English and Swahili.	No published result. The target is more than one million smallholders. The EU takes over 50% of Kenya's coffee exports.	This is an announcement only. The article does not say which functions use AI. The EU proposed delaying the regulation, so check its current status before teaching. Source: "Kenya's coffee farmers go digital to meet EU deforestation rules", AgNavigator (formerly AgTechNavigator), 14 Oct 2025. (accessed 11 Nov 2026).	14

Case	What the AI does	Result	Limits and source	Sessions
One Acre Fund Burundi (AI reads farm paperwork)	Text-reading software (OCR) reads about 80,000 scanned paper delivery forms a year and checks them against digital survey records. Staff then look only at the entries the system flags in yellow or red.	The company says the work fell from more than 1,000 person-days per cycle to an estimated 300 to 500, a 50 to 70% reduction; the headline claim is "up to 70%". More than 80,000 forms were processed in 2 to 3 weeks. The tool went from prototype to pilot in about two weeks.	This is a vendor claim, and the reduction is the vendor's own estimate. Other reports describe One Acre Fund models that predict which farmers may not repay. That was not on the page read, so do not cite it from this source. Source: "One Acre Fund" customer story, Dataiku, 30 Jul 2026. (accessed 11 Nov 2026).	1, 11, 12
Farmerline Darli AI (voice and WhatsApp advisor)	Farmers send a text, a voice note or a photo on WhatsApp, or call a voice line, and get advice on pests, fertiliser, harvest and markets in their own language. It can diagnose crop problems from photos.	Used by 110,000 farmers by October 2024. Available in 27 languages, including Twi, Swahili and Yoruba. Named one of TIME's Best Inventions of 2024.	The user count is from the company. Later figures ("over 1 million users") come from GSMA, whose page could not be opened, so they are not used here. There is no published yield or income result. Source: Wilser J., "Farmerline Darli AI", TIME Best Inventions 2024, 30 Oct 2024. (accessed 11 Nov 2026).	
Sunbird AI "Sunflower" (Ugandan-language model)	A locally built language model that understands and translates Luganda, Runyankole, Ateso, Acholi, Lugbara and other Ugandan languages. The government expects it to send farmers weather updates and crop advice in their own language.	No published result.	No farmer deployment figures yet. Use it as a local-language and sovereignty discussion case, not as proof of results. Tech outlets claim it outperforms global models in most Ugandan languages; that was not verified here. Source: "Uganda launches an Artificial Intelligence (AI) language model", Ministry of ICT and National Guidance, 15 Oct 2025. (accessed 11 Nov 2026).	4, 6, 8
ICRISAT and Microsoft AI sowing app	It analysed 30 years of climate data and weather forecasts to choose the best sowing date, then texted farmers advice in Telugu or Kannada. Farmers needed only a basic phone.	The 175 farmers in the 2016 pilot achieved "an average of 30% higher yield per hectare". In the 2017 expansion to more than 3,000 farmers, yield gains ranged from 10% to 30% across crops.	The source is Microsoft's own feature, and the figure is not independently checked. It is a small pilot from 2016 to 2017. The comparison group and method are not described. Present 30% as a pilot figure, never as typical. Source: "Digital Agriculture: Farmers in India are using AI to increase crop yields", Microsoft News Centre India, 7 Nov 2017. (accessed 11 Nov 2026).	
Kisan e-Mitra (Government of India chatbot)	A voice and text chatbot answers farmers' questions about the PM-KISAN income-support scheme, such as payment status and registration, in 11 languages. It finds the farmer's own record and uses an AI model to word the answer.	About 2.69 million questions answered in 186 days, about 13,000 a day; the footnoted period is 6 March to 5 August 2024. Wadhwani reports this as a 668% increase over the old manual grievance process.	No accuracy figure is published. The "186 days" and the footnoted dates do not match (about 152 days), so quote "about 2.7 million questions in 2024". Source: "Empowering millions of Indian farmers with instant AI chatbot support", Wadhwani AI, 6 Nov 2025. (accessed 11 Nov 2026).	8
ITC Krishi Mitra (GenAI farmer copilot)	A chatbot inside ITC's farmer app answers farmers' voice questions in regional languages about crops, weather and practices. It is built on Microsoft's copilot templates.	No published result.	Microsoft materials (not opened) talk of a 300,000-farmer pilot and a 10-million target. Those are targets, not results. Use this to show a large commodity buyer building on a vendor template. Source: "ITC's Krishi Mitra uses Microsoft Copilot to help farmers" (Hindu BusinessLine, republished by ITC), 4 Apr 2024. (accessed 11 Nov 2026).	6, 7

John Deere See & Spray (global benchmark)	Cameras on the sprayer boom tell weeds from crop plants as the machine moves, and spray herbicide only on the weeds instead of the whole field.	Deere reports that customers saved 59% of herbicide mix on average in 2024, about 8.3 million gallons across roughly 1 million acres. One Kansas farmer's own figures for 2024: running costs of $3.33 per acre against chemical savings of $2.52 per acre, a net cost of $0.81 per acre.	The 59% is a company-reported average; Deere notes that results vary by weed pressure and crop. The single-farm economics are one operator in one season. This works well in class as "ROI depends on your farm". Source: Miller D., "Sense and Act Technology Brings Sharper Precision to Spraying", DTN Progressive Farmer, 25 Apr 2025. (accessed 11 Nov 2026). The original Deere ...	10

Procter & Gamble "Cybernetic Teammate" field experiment	P&G staff working on real product-development problems (baby care, grooming, oral care) used an internal GPT-4 tool to generate and refine ideas. They were randomly assigned to work alone or in teams, with or without AI.	Individuals with AI matched the quality of two-person teams without AI. Teams with AI were three times more likely than individuals without AI to produce top-10% ideas. Time spent fell by 16% for individuals and 13% for teams. AI users reported more enthusiasm and less anxiety. Less experienced staff with AI performed comparably to experienced colleagues.	HBS says 791 participants and other summaries say 776. Say "about 780 P&G professionals". It was a one-day task after one hour of training, at one company, so longer-term effects are unknown. Source: Nover S., "When AI joins the team, better ideas surface", HBS Working Knowledge, 17 Oct 2025. (accessed 11 Nov 2026). Paper: Dell'Acqua F. et al., "The ...	7, 12
Coca-Cola AI-generated Christmas advert (mixed or failure)	Coca-Cola remade its 1995 "Holidays Are Coming" truck advert using generative AI video instead of a traditional film shoot.	Online reaction was strongly negative. Critics called it "soulless" and saw it as a threat to creative workers. Yet System1, which tests how consumers feel about adverts, scored it 5.9, a top score, in both the US and UK. Coca-Cola stood by the campaign.	No sales effect was published. Good for discussion: "Who decides whether this failed: social media or the test panel?" Source: "How Coca-Cola's AI holiday ad went from praise to rage", Adweek, issue of 17 Dec 2024. (accessed 11 Nov 2026). Backlash also reported by Campaign Asia (Nov ...	0, 1, 2, 5, 10, 11, 14
Coca-Cola AI suggested orders for retailers	When a small shop orders on the bottler's app or WhatsApp, the system suggests which products and how many to buy. It bases this on past orders, season, weather and similar shops. The shopkeeper decides.	On the Q2 2024 earnings call, Coca-Cola said retailers receiving AI recommendations in early pilots were more than 30% more likely to buy the recommended products. In Q1 2024, AI suggested orders reached more than 3 million outlets in Latin America. In Malaysia (January to April 2026), 83% of the shops that joined the campaign adopted the recommendations; ...	All figures are company-reported. "30% more likely to buy" is not "30% more sales". Coca-Cola did not disclose the uplift for Malaysia. Check the Q2 2024 transcript before quoting it on a slide. Source: "Coca-Cola uses AI to guide retailer ordering in Malaysia", AI News (artificialintelligence-news.com), 8 Sep 2026. (accessed 11 Nov 2026).	0, 1, 2, 5, 10, 11, 14
Coca-Cola HBC (image recognition, digital twins, GenAI)	Sales reps photograph shelves and coolers, and image recognition gives an in-store score of how well the products are displayed. A factory "digital twin" (with Microsoft), a virtual copy of a production line, lets engineers test settings before changing the real line.	About 60 to 70% of sales visits use image recognition. A one-line digital twin prototype reportedly delivered 90% energy savings over 12 months. Image recognition takes 3 to 4 months per market to move from learning to adoption.	The figures come from an interview with the company's chief digital officer. The 90% energy figure is from one prototype line. Do not generalise it. Source: Mathieu H., "Why Coca-Cola HBC is looking for balance on AI", Just Drinks, 12 Dec 2023. (accessed 11 Nov 2026).	0, 1, 2, 5, 10, 11, 14
AB InBev BEES at Nile Breweries (B2B ordering)	BEES is an ordering app that lets bars and shops order beer 24 hours a day, see deals and arrange delivery, instead of waiting for a sales rep. BEES's own site says it now generates AI suggested orders from past purchases, but no Ugandan figures exist for that feature.	In Uganda, about 1,000 users registered in the first nine days after launch (2022). Uganda was the third African BEES market, after South Africa and Tanzania.	The Ugandan source does not mention AI. Teach this as "digitise ordering first", and point to MFG-03 for what AI then adds. Source: Nile Breweries BEES launch report, Watchdog Uganda, 24 Jun 2022. (accessed 11 Nov 2026).	14
Kenya Breweries (EABL) Diageo One ordering platform	Retailers order through distributors on a mobile app, see promotions they qualify for, and earn loyalty points. Distributors use it to plan delivery routes.	12,000 active retailers. The digital share of sales rose from 8% to 60% in the year to 30 June 2024, and on-time delivery to retailers improved from 80% to 90%.	This is not AI. It is the data foundation an AI ordering tool needs. Use it in S14 only. The figures are from company executives. Source: "E-commerce platform boosts KBL sales", Capital FM Business (Kenya), 2 Sep 2024. (accessed 11 Nov 2026).	

Case	What the AI does	Result	Limits and source	Sessions
Unilever and Accenture factory digital twins	It builds live virtual copies of production lines, fed by shop-floor data. AI predicts problems such as blockages or quality drift, and proposes or makes adjustments.	At Raeford, USA, the system predicts 95% of process-flow restrictions, with waste down 20% and capacity up 10%. At Poznan, Poland, minor stoppages fell by up to 20% and waste by nearly 30%. At Gandhidham, India, quality defects fell 30% over four years. At Cu Chi, Vietnam, 1 to 2% of premium ingredients were saved. Unilever plans more than 40 new twins over ...	The results are company-reported, most without a time period or baseline. Unilever also holds 11 WEF "Lighthouse" factory designations (2026), but that page could not be opened, so it is not used. Source: Tanner B., "Unilever scales AI-enabled digital twins across global manufacturing network with Accenture", Intelligent CIO, 16 Jun 2026. (accessed 11 Nov 2026).	9, 11
Unilever AI video interviews (HireVue) (mixed)	Graduate applicants recorded video interviews, and software scored their word choice, tone and facial expressions against people already successful in the role. Its score decided who moved forward to human interviews.	Unilever said it saved about 100,000 hours of interviewing time and roughly $1m in recruitment costs a year globally (2018, reported 2019). Unilever could not confirm the vendor's diversity claims, because candidates did not disclose gender or ethnicity at that stage.	The vendor's own case study says 50,000 hours, not 100,000; quote Unilever's figure and say it is a company estimate. HireVue says it removed facial analysis from new assessments in early 2020. Whether Unilever still uses the tool today is not confirmed. Source: "Unilever saves money, human hours using artificial intelligence", Eastern Eye, 26 Oct 2019, citing The Guardian. Oates J., "Unilever using AI and facial ...	9, 11
Nestlé NesGPT (staff GenAI assistant)	An internal ChatGPT-style assistant for office staff, used to draft, proofread, generate ideas, analyse data and explain new topics.	In three months, more than 7,000 US employees sent nearly 230,000 prompts. Users estimated in an internal survey that they save an average of 45 minutes per week.	The time saving is self-reported in a survey and was not measured. The figure is from 2024. Source: Callahan C., "A year in: Nestlé employees save 45 minutes per week using internal generative AI", WorkLife (Digiday), 23 Jul 2024. (accessed 11 Nov 2026).	5, 6, 7
GE Predix (failure of an industrial AI platform)	Predix was meant to be a cloud platform that gathered sensor data from jet engines, turbines and factories, and predicted failures and improved performance.	CEO Jeff Immelt spent six years and more than $4 billion on the digital push. In 2017 GE paused development for two months to fix technical problems. It dropped its plan to build its own cloud and moved to Amazon Web Services instead. The 2020 digital revenue target was lowered from $15 billion to $12 billion, after redefining what counted. Senior leaders ...	The figures are from 2017. Later developments (GE put digital assets up for sale in 2018) were not opened here. Predix was not the sole cause of GE's wider decline. Source: Scott A., "GE shifts strategy, financial targets for digital business after missteps", Reuters via Fox Business, 28 Aug 2017. (accessed 11 Nov 2026).	
Heidelberg Materials and Carbon Re (cement kiln AI)	AI software sits on top of the plant's existing control system and continuously adjusts the cement kiln to burn less fuel while keeping quality steady.	In the first month of continuous operation: the fuel cost index fell 4.1%, fuel-related carbon emissions fell 4.5 kg per tonne of clinker (2%), heat consumption fell 2.2% (after controlling for fuel mix and raw materials), and quality variation fell 33%. The results were checked by switching the system on for one month and off for the next.	The result covers one month at one plant and is not independently audited. No savings in money are published. Relevant to African cement makers, but no African plant result was found. Source: "Heidelberg Materials and Carbon Re AI integration to improve kiln performance", World Cement, 8 Oct 2024. (accessed 11 Nov 2026).	10
Heineken Beverages Sedibeng Brewery (AI in brewing)	It is piloting software that predicts beer colour and cloudiness well before final quality checks, and uses an AI program from equipment-maker Meura to shorten filtering time and reduce losses of beer extract.	No published result. The colour and cloudiness prediction is still a pilot.	Pilot only, with no figures. Use it as an African example of "AI arrives inside the equipment you buy". Source: "AI and eco-innovation: The new wave in SA's beer industry", Bizcommunity, 16 Dec 2025. (accessed 11 Nov 2026).

Penda Health "AI Consult" clinical copilot	While a clinician sees a patient, a large language model reads the clinical notes in the background. It flags possible errors in history-taking, investigations, diagnosis or treatment as a traffic-light alert, and the clinician keeps the decision.	The study covered 39,849 patient visits in 15 clinics, comparing clinicians with and without AI Consult. Clinicians with the tool made "16% fewer diagnostic errors and 13% fewer treatment errors". The authors estimate that at Penda alone this would avert diagnostic errors in 22,000 visits and treatment errors in 29,000 visits a year. All clinicians surveyed ...	OpenAI funded the study and co-developed the tool. It is a quality-improvement study inside one health network, not a randomised trial across systems. The error reductions are relative, not absolute. Check whether a peer-reviewed version has since been ... Source: "AI-based Clinical Decision Support for Primary Care: A Real-World Study", arXiv:2507.16947, submitted 22 Jul 2025; accessed 11 Nov 2026.	0, 5, 7, 8
Jacaranda Health PROMPTS: AI triage of mothers' SMS messages	Pregnant women and new mothers text questions in English, Swahili or a mix of both. A language model (TRIM-AI) scores each message for danger signs, so that a small help-desk team answers the urgent ones first and calls flagged mothers within an hour.	TRIM-AI is "roughly 17%" more accurate than Jacaranda's earlier baseline AI model at predicting high-risk conditions. It cut help-desk workload by about 12%. PROMPTS had more than 350,000 active users and received 1.1 million messages a month (Feb 2023).	The 17% gain is measured against Jacaranda's own earlier model, not against human agents. User numbers come from the organisation itself. This is not an independent outcome evaluation. Source: "New AI tool helps provide better care for pregnant women", Penn State News, 6 Feb 2023; accessed 11 Nov 2026. The underlying paper is at AAAI 2023 ("A ...	2, 4, 6, 11, 12
AI-read Pap smears at a rural Kenyan clinic	A portable scanner photographs Pap smear slides at the clinic and uploads them over the mobile network. A deep-learning model then flags slides with abnormal cells, so that the scarce pathologist reviews only the suspicious ones.	The study took smears from 740 HIV-positive women. Measured against pathologists reading the digital slides, the AI found general atypia with 95.7% sensitivity and 84.7% specificity. Against the physical glass slides it reached 100% sensitivity and 78.4% specificity. The authors suggest pathologists could skip about 70% of slides.	This is a single-site proof of concept. Specificity is lower than sensitivity, which means more false alarms (a good S3 teaching point). A later Kenyan news figure of "up to 99%" accuracy is not peer-reviewed; do not use it. Source: Holmström O. et al., "Point-of-Care Digital Cytology With Artificial Intelligence for Cervical Cancer Screening in a Resource-Limited Setting", JAMA Network ...	
Makerere AI Health Lab: smartphone malaria microscopy	A 3D-printed adapter clips a smartphone onto an ordinary lab microscope. AI then marks malaria parasites in the blood-smear image for a technician to confirm.	No published accuracy result was found. The lab says results come in under 60 seconds, compared with about 15 minutes for rapid tests and 25 to 30 minutes for microscopy. The tool is "still in the testing phase" (May 2025).	It is a pilot, and the speed figures are the lab's own claims. Use it as a home-grown build example, not as proven impact. Source: "AI Tool to Revolutionize Malaria Diagnosis in Uganda", Makerere University CoCIS, 2 May 2025; accessed 11 Nov 2026.	1, 14
Kenya Social Health Authority (SHA): AI fraud engine, and wrongly rejected claims	SHA's claims system uses an AI-driven engine to spot unusual patterns in hospital claims and member records in real time. Flagged claims are rejected or sent for investigation.		The 381-dependant and dialysis examples are the minister's own statements. The Kigumo figures come from one hospital and were posted on social media by the Kenya Medical Association president. This is an excellent S3 case: the same engine is praised for ...	
Babyl (Babylon Health) in Rwanda: when the vendor collapses	Babyl ran a national telemedicine service, integrated with national insurance schemes, under a 10-year partnership with the government. Its UK parent marketed AI symptom-checking. The sources read do not describe AI triage in the Rwandan service, which was mainly phone consultation.	The service had more than 2.5 million registered users, about 18% of Rwanda's population. After the parent company's take-private deal collapsed and it went bankrupt in August 2023, Babyl Rwanda ceased operations (reported 24 Sep 2023). The parent had a net loss of $221.4 million on $1.1 billion revenue in 2022.	Teach this as a buy-versus-build and vendor-continuity case, not as an AI-accuracy failure. User figures vary between 2.5 and 2.8 million across sources.	

Case	What the AI does	Result	Limits and source	Sessions
AI chest X-ray reading for TB in north-east Nigeria (and WHO guidance)	Software reads each chest X-ray in seconds and scores how likely TB is. Only people above the threshold are sent for the confirmatory sputum test, which replaces a radiologist the camps do not have.	The camps screened 5,297 people across 66 camps. Of 1,021 Xpert tests, 85 people (8%) had confirmed TB. At a score of 0.50 or more, qXR identified 89.4% of TB cases with 62.8% specificity. Screening on "any symptom" caught 90.6% of cases but with only 11.4% specificity, and asking about prolonged cough found only 40%. In March 2021 WHO updated its TB ...	Check the figures against the BMC paper before teaching. The WHO news page did not itself state the exact wording of the CAD recommendation (conditional, ages 15 and over, according to secondary sources); quote it only after reading WHO Module 2. A good S3 ...	
South African medical schemes: fraud-detection algorithms and the Section 59 racial-bias finding	Scheme administrators run software that analyses claims data to flag doctors whose billing looks irregular. Investigators then pursue those doctors and claw back money.		Discovery and the Board of Healthcare Funders publicly reject the findings as methodologically flawed (Business Day, 8 Jul 2025). The panel itself says it made findings of fact, not legal rulings. Present both sides.	3, 4, 5, 10, 12
Google Health diabetic eye screening in Thai clinics	Nurses photograph the back of a diabetic patient's eye, and the AI grades it for diabetic retinopathy in about a minute. Patients who need a specialist are referred on the spot.	In internal tests the system showed 90% accuracy. In 11 real clinics it rejected images that were blurred or dark (only some clinics had a room that could be darkened). Slow internet made some uploads take 60 to 90 seconds. Some nurses discouraged patients from joining because of the burden of on-the-spot referral. No overall rejection rate is quoted here, ...	This was an early deployment. Do not imply the product later failed. The lesson is the gap between lab accuracy and the clinic.	1
MASAI trial: AI-supported mammography screening, Sweden	AI scores each mammogram for cancer risk. Low-risk exams get one radiologist instead of the usual two, and high-risk exams get two radiologists.	The interim safety analysis covered 80,033 women. The AI arm found 41 more cancers (about 20% more) than standard double reading, with no increase in false positives reported. Screen readings fell from 83,231 to 46,345, which is 44% less radiologist reading work.	These are interim results from one site. The primary endpoint (interval cancers, after at least two years of follow-up of 100,000 women) was pending at the time. Check for the final results before teaching. The authors warn that finding more cancers can also ... Source: "AI supported mammography screening could save lives and reduce workload for radiologists", News-Medical (reporting The Lancet Oncology), 1 Aug 2023; accessed ...	1
Epic Sepsis Model: vendor accuracy versus real-world accuracy	The model sits inside the hospital's electronic record and scores every inpatient's risk of sepsis. Above a threshold, it alerts the care team.	Across 38,455 hospitalisations, the area under the curve (AUC, a standard accuracy measure) was 0.63, against the 0.76 to 0.83 that had been reported. The model missed 67% of sepsis patients, yet it alerted on 18% of all inpatients, "creating a considerable burden of alert fatigue".	Epic disputed the method, saying the two sides define sepsis onset differently. The lesson is to validate a vendor model on your own data. Source: "Epic Sepsis Model Has Poor Discrimination of Sepsis", HealthDay (reporting Wong A. et al., JAMA Internal Medicine, 21 Jun 2021), 22 Jun 2021; accessed 11 Nov ...	3
Optum "Impact Pro": cost used as a stand-in for need	The algorithm predicts which patients will cost the most next year. Hospitals and insurers used that score to choose who gets extra care-management support.	Black patients made up 17.7% of those above the 97th percentile when ranked by predicted cost. When ranked by number of chronic illnesses, the share was 46.5%. Retraining with health measures alongside cost cut the disparity at each risk score by 84%.	Optum cooperated with the researchers and retrained the model. Present it as a fixable design flaw, not malice. Source: "Bias in a common health care algorithm disproportionately hurts black patients", Science News, 24 Oct 2019; accessed 11 Nov 2026. The paper is Obermeyer Z. ...	

Case	What the AI does	Result	Limits and source	Sessions
UnitedHealth / naviHealth "nH Predict" lawsuit	The tool predicts how long an elderly patient should need care after a hospital stay. The lawsuit alleges the insurer used those predictions to cut off covered care.	These are allegations, not findings. The lawsuit claims the tool had a "90% error rate", with more than 90% of appealed denials reversed, and that the insurer counted on only about 0.2% of policyholders appealing. UnitedHealth says the tool "is not used to make coverage determinations" and calls the suit meritless.	Always say "alleged". The case status after 2023 was not checked. It is useful for showing how the share of appeals reversed reveals error rates. Source: "UnitedHealthcare used AI to deny patients health insurance coverage, lawsuit says", Medical Economics, Nov 2023; accessed 11 Nov 2026.	
Lemonade: automated claims, and an AI claim that backfired	A chatbot ("AI Jim") takes the first notice of a claim in the app, checks it against the policy and runs anti-fraud checks. It then pays simple claims instantly or hands the claim to a human.	Lemonade's 2020 SEC filing (as cited in coverage) says the bot handled first notice of loss for 96% of claims as of 30 Sep 2020, and resolved about a third of claims with no human involvement. In May 2021 Lemonade tweeted that its AI picks up "non-verbal clues" in claim videos. After public backlash it deleted the tweets, said AI never auto-denies claims, ...	The 96% and one-third figures were read second-hand from the SEC filing; check the 10-K before quoting. The "2-second claim" records are company publicity. The key lesson is that claiming more than the AI does is a reputational risk in its own right. Source: "Lemonade's Tweet About AI-Driven Fraud Detection Sparks Public Relations Crisis", Claims Journal, 28 May 2021; accessed 11 Nov 2026.	10

Case	What the AI does	Result	Limits and source	Sessions
Uganda Revenue Authority: AI on revenue leakage, built on a messy taxpayer register	URA uses AI and data analytics to spot tax evasion, such as undeclared imports and false VAT claims, by cross-checking records. It is also moving taxpayer registration from TIN to the national ID number (NIN).	Commissioner General John Rujoki Musinguzi said: "Last year alone, URA recovered 200 billion shillings in revenue leakages uncovered through the use of AI" (April 2025). An earlier URA staff study (2019) found "considerable problems of inaccurate data" in the taxpayer register: duplicated phone numbers and emails, and taxpayers holding several TINs.	The UGX 200bn figure is a speech claim with no published method or audit. The 2019 data-quality findings may have improved since then. Daily Monitor coverage of URA's AI use exists but could not be opened.	0, 5, 9, 11, 14
Kenya Revenue Authority: AI risk engines and automatic return checks	From 10 January 2026, iTax automatically checks declared income and expenses against electronic invoices (eTIMS), withholding-tax records and customs import data. Mismatches trigger audits, delayed refunds or rejected returns. Customs has piloted AI-powered risk engines.	No published result specific to AI was found. Reported context: customs revenue reached a record Sh85 billion in one month, and VAT rose from Sh20bn to Sh28bn a month since 2021/22 (President Ruto, 20 Nov 2025). Economist David Ndii said: "In a year or two, most of our taxes will be collected by algorithms and not by people."	The revenue growth cannot be attributed to AI. The legal basis is Section 23A of the Tax Procedures Act. Small and informal firms may be flagged because their records are incomplete (a fairness and people point).	
South African Revenue Service: auto-assessment and AI fraud detection	SARS uses third-party data (employers, banks, medical schemes) with machine learning to issue tax assessments without the taxpayer filing a return. The same models flag suspicious refund claims before money leaves.		The figures are SARS's own, reported by media. The compliance yield is not all from AI. A widely quoted R444bn "outflows prevented" figure (2024/25 annual report) was not read here; do not use it without opening the report.	3, 4, 5, 10, 12
Judiciary of Kenya: AI transcription and an AI policy for courts	Speech-to-text software transcribes court proceedings. The judiciary is drafting a policy that keeps AI as decision support (transcription, organising information, research) and not for writing judgments.	Chief Justice Martha Koome said transcription is now "majorly done by AI". She put accuracy at about 80%, up from about 30% when testing began (Aug 2025).	The accuracy figures come from a speech and have not been independently measured. A draft "AI Policy for the Judiciary of Kenya" v2.0 appeared online (2026); its adoption status was not confirmed. Source: "AI court transcriptions in Kenya", Tech-ish, 13 Aug 2025; accessed 11 Nov 2026.	1, 4, 13
Uganda's national digital ID (Ndaga Muntu): exclusion when ID becomes the gate		Based on official sources, up to one third of Ugandan adults had not received an ID card. At least 50,000 Ugandans over 80 had ID errors or no ID, making them ineligible for the Senior Citizens' Grant. More than USD 200 million had been spent on the system over the previous decade. Older people's worn fingerprints are often rejected by the scanners.	These are 2021 figures. Present it as data-readiness and governance context, not as an AI failure. It ties to URA's TIN-to-NIN move (PUB-01). Check the current figures and the status of the 2022 lawsuit. Source: "Chased Away and Left to Die" (press release and report), Center for Human Rights and Global Justice (NYU), ISER and Unwanted Witness, 8 Jun 2021; accessed 11 ...	
National AI policies: Rwanda, Kenya, Uganda, Nigeria		No measured result (these are policies).		0, 13, 14
Togo Novissi: machine learning to target emergency cash	Satellite images were used to find the poorest areas. Mobile-phone usage patterns were then used to predict which subscribers in those areas were poorest, so cash could be sent to their phones without a social register.	The approach identified and enrolled 138,500 recipients for the rural expansion. Compared with giving to everyone in selected villages, it reduced exclusion errors (poor people missed) by 4 to 21%. Households without a phone, about 15%, would be missed.	The researchers say it should complement, not replace, a proper registry when time and data allow. The working paper also reports that, against a full registry (which Togo did not have), exclusion errors would be higher. Source: "Using machine learning and mobile phone data to improve the speed and cost-effectiveness of social protection", J-PAL, updated Jun 2026; accessed 11 Nov ...	2

Case	What the AI does	Result	Limits and source	Sessions
Edo State, Nigeria: GPT-4-based after-school tutoring (World Bank pilot)	First-year senior secondary students worked in pairs with Microsoft Copilot (GPT-4-based) as an English tutor, twice a week for six weeks. Teachers set the topic, the prompts and the reflection.	Students scored about 0.3 standard deviations higher than the control group, which the World Bank equates to "nearly two years of typical learning" in six weeks. The pilot outperformed 80% of education interventions in a database of randomised trials in developing countries. Girls, who started behind, gained more.	It was a six-week pilot, and the full paper was "soon to be published" when the blog appeared. Attendance was hit by floods, strikes and power outages. Long-term effects are unknown.	5
Mavundla v MEC (KwaZulu-Natal High Court): fake AI-generated case law	Lawyers filed submissions citing court cases produced by an AI research tool without checking them. The judge checked them.	Only 2 of 9 authorities cited were genuine. The court called the conduct "irresponsible and unprofessional" and referred the lawyers to the Legal Practice Council. A June 2025 Gauteng case (Northbound Processing) followed the same approach.	Which tool was used is disputed. TechCentral names ChatGPT, the candidate attorney denied using it, and some law-firm notes name "Legal Genius". Say "an AI tool". Source: "South African lawyers learn hard lesson in AI fiction", TechCentral, 7 Nov 2025; accessed 11 Nov 2026. Judgment: Mavundla v MEC: Department of Co-operative ...	5
UK Government Microsoft 365 Copilot experiment	More than 20,000 civil servants in government organisations got an AI assistant inside Word, Outlook and Teams. They used it to draft documents, summarise meetings and handle email.	Average self-reported time saving was 26 minutes per user per day, or "nearly 2 working weeks" per person per year (3-month experiment).	The savings are self-reported survey estimates, not measured time. Secondary coverage (The Register) says 17% of respondents reported no time saved. It is a good S3 case on how a productivity number is built. Source: "Landmark government trial shows AI could save civil servants nearly 2 weeks a year", GOV.UK, 2 Jun 2025; accessed 11 Nov 2026.	4, 7
Dutch childcare benefits scandal (toeslagenaffaire)	A self-learning risk model scored childcare-benefit applications for likely fraud. Non-Dutch nationality was one risk factor, and flagged families had benefits stopped and were investigated.		Exact numbers of families vary by source (about 26,000 is often quoted, but it was not read here). Say "tens of thousands".	9
Robodebt, Australia	It matched tax-office annual income data against welfare records, averaged annual income evenly across fortnights, and automatically raised a debt wherever the averaged figure differed from what the person had reported. Human checking was largely removed.		This was not machine learning; it was a simple automated rule. That is exactly the point: rules without humans fail like AI does. Dollar figures (for example the A$1.8bn settlement) were not read on an opened page; do not quote them.	10
Michigan MiDAS unemployment-fraud system	An automated system (MiDAS) judged unemployment claimants guilty of fraud. In many cases no human was involved, and penalties, wage garnishment and seized tax refunds followed.		Different sources describe the 93% and 85% figures differently. Quote the 85% (computer-only) versus 44% (human) comparison, which this page states clearly. A later $20m class settlement (Bauserman) was seen only in search results. Source: Insurance Journal (AP), "Michigan to refund $21M after unemployment fraud cases reversed", 14 Aug 2017; accessed 11 Nov 2026.	3
Ofqual 2020 exam-grade algorithm	With exams cancelled during COVID, a statistical model adjusted teachers' predicted A-level grades using each school's past results. Teacher grades were used only for very small classes.	39% of teacher-assessed A-level grades were marked down. Private schools increased their share of A and A* grades by 4.7 percentage points, more than double any other school type. After protests, on 17 Aug 2020 Ofqual reversed the decision and used teacher grades.	This was a statistical standardisation model, not machine learning. It is a good public-legitimacy lesson: a model that is fair "on average" fails individuals. Source: "U-turn will mean A-level and GCSE teacher grades stand", Tes, 17 Aug 2020; accessed 11 Nov 2026.	

Energy, mining, oil and gas (5 cases)

Case	What the AI does	Result	Limits and source	Sessions
Kenya Power: "Nuru" chatbot and digital channels	Nuru is Kenya Power's first AI chatbot, on its website and its KenyaPowerCare Facebook page, answering customer questions around the clock. Customers can report outages, get account information and pass to a human care agent in real time.	In the financial year ending 30 June 2025, calls to the contact centre fell by 900,000, from 5.2 million to 4.3 million. The press attributes the fall to digital engagement in general (app, USSD, web), not to the chatbot, which launched after that year ended. No published result for Nuru itself.	The call reduction is for the year before Nuru launched; do not credit it to the chatbot. Use the case as "a regional utility moving to digital self-service", not as a measured AI win. Nothing comparable found for Umeme or UEDCL in Uganda.	
M-KOPA: machine learning to forecast repayment on every loan, daily	Machine learning models forecast the repayment of every loan in the portfolio every day, giving early warning when a customer's payment pattern changes. This guides pricing and which customers get follow-on products.	No percentage published. The company says AI produced significant increases in repayment performance, especially for follow-on products. Context figures from the same source: "more than 3 million customers"; "more than $1 billion in credit" by 2022; over 12,400 sales representatives and employees in Kenya.	Vendor-partner feature; no independent figure on accuracy or repayment uplift. Figures date from 2022-2023. No equivalent published AI claim found for Sun King, whose credit checks are described as agent-led.	
Shell: predictive maintenance on 10,000+ pieces of equipment (with C3 AI)	Sensors on control valves, pumps, compressors and other critical equipment feed models that predict when a machine is likely to fail. Engineers can then fix it before it breaks.	More than 10,000 pieces of equipment monitored; about 20 billion rows of data a week from more than 3 million sensors; nearly 11,000 machine-learning models making more than 15 million predictions a day (March 2022). No savings figure in the trade-press account. Vendor-reported 2026 update: more than 13,000 pieces of equipment and "hundreds of millions of ...	Figures originate with the vendor. Teach the scale and the data foundation, not the dollar value.	11
Rio Tinto: autonomous haul trucks in the Pilbara iron-ore mines	Driverless haul trucks, controlled by an autonomous haulage system and supervised from a remote operations centre, carry ore and waste around the mine. The trucks do not need breaks or shift changes.	In 2017 each autonomous truck operated on average about 700 hours more than a conventional truck, with about 15% lower load and haul unit costs. The autonomous fleet passed one billion tonnes hauled and moved roughly a quarter of total Pilbara material in 2017. About a fifth of Rio's roughly 400 Pilbara haul trucks were autonomous at the time.	Company-reported 2017 figures; later blogs quoting "2026" numbers could not be traced to Rio Tinto and are excluded. Safety benefit is claimed but not quantified in the source.	1
Octopus Energy: AI-drafted customer emails, then an AI email agent ("Arlo")	Generative AI drafts or sends replies to customer emails. In the 2026 "Arlo" trial, the AI answered some emails itself, while sensitive cases, complex complaints and vulnerable customers stayed with human staff.	2023 (CEO claim in The Times): AI was doing the work of about 250 people answering emails; customer satisfaction 80% for AI-assisted emails versus 65% for humans; CEO said job cuts unlikely. 2026 trial (company): Arlo handled about 8,000 emails a week, about 4% of UK customer emails, over three months, with satisfaction of 76% versus 72% for comparable ...	Both figures are company-reported. The 2023 and 2026 numbers describe different systems; do not combine them.	8, 10

Retail, logistics and transport (7 cases)

Case	What the AI does	Result	Limits and source	Sessions
Air Canada: the company is liable for what its chatbot says (Moffatt v Air Canada)	A website chatbot answered a bereaved passenger's question about bereavement fares. It wrongly told him he could claim the discount retroactively within 90 days; the real policy required a request before travel.	The British Columbia Civil Resolution Tribunal (2024 BCCRT 149) rejected Air Canada's argument that the chatbot was a separate legal entity responsible for its own actions, holding that the chatbot is part of the airline's website. Air Canada was ordered to pay about CAD 812 in damages, interest and fees (claim was CAD 880).	Small-claims tribunal, so the sum is tiny; the lesson is liability and reputation, not the amount.	5, 9
DPD: customer-service chatbot swears and criticises the company	DPD's chat assistant combined scripted answers with a generative AI element. After a system update, a frustrated customer got it to swear, write a poem criticising DPD and call itself useless.	DPD said an error occurred after a system update, immediately disabled the AI element and began updating it. No business figure published; the screenshots spread widely on social media.	Reputational incident, no financial loss reported.	5
McDonald's and IBM: AI drive-through ordering test ended	Voice AI took customers' orders at the drive-through instead of a crew member. It had to understand speech in noisy settings, across accents.	Tested at about 100 restaurants; McDonald's ended the partnership on this product in June 2024. A 2022 analyst report put ordering accuracy in the low 80% range against McDonald's target of 95%-plus before wider rollout; viral videos of wrong orders drew attention. McDonald's said voice ordering will still be part of its future.	The "low 80%" accuracy figure is an analyst estimate (BTIG, 2022), not a McDonald's figure.	9
Amazon: AI demand forecasting model	A forecasting model predicts what customers will want, where and when, for hundreds of millions of products each day, using sales history plus things like weather and holidays. Inventory is placed nearer to expected demand.	Company states a 10% improvement in long-term national forecasts for deal events and a 20% improvement in regional forecasts for millions of popular items.	Self-reported; the baseline and measurement method are not published.	6
Jumia: AI workflows and headcount reduction	Jumia says it is using AI-driven workflows in customer service, marketing, technology operations and other internal work. The aim is lower operating costs on the path to profitability.	Headcount fell about 7% from 31 Dec 2024 to just over 2,000 by 30 Sep 2025, tied by the company to AI-driven cost optimisation. Q3 2025: general and administrative costs down 7% to USD 17.6 million; operating loss down 13% to USD 17.4 million (not attributed to AI specifically). May 2026: plans to cut about 200 more jobs (roughly 10%) as AI tools roll out; ...	A claim that "over half" of customer interactions run through conversational AI appeared in one secondary source only and is excluded. Do not say AI caused the loss reduction.	10
Kenya Airways: staff assistant, data lake, AI policy approved by the board	More than 1,000 staff use an AWS assistant (Amazon Quick) for daily work; AI speeds the review of maintenance documents; a data lake gives each customer one identifier so disrupted travellers can be spotted early. Separately (May 2026) the airline adopted an AI fare-pricing platform (FlyNava ...	No measured figure. The CIO says tasks that took days or weeks now take hours. The data lake is described as still under construction.	Said at a vendor (AWS) event. Useful for governance and the thin-margin context: the CIO says African airlines make under USD 2.50 net profit per passenger.	6, 13

Case	What the AI does	Result	Limits and source	Sessions
Uber Eats: facial-recognition ID check and a discrimination claim	Couriers must pass a real-time selfie check that compares their face to the account photo. After "continued mismatches", a Black courier was removed from the platform through an automated process.	The courier, funded by the Equality and Human Rights Commission and his union, brought claims of indirect race discrimination, harassment and victimisation, and received an undisclosed settlement in March 2024; he was reinstated. Uber says checks have "robust human review" and that the automated check did not cause the removal. The bias question was never ...	Settled without admission. Name only the organisation in class, not the individual; the brief bars personal data on private individuals.	1

Education (7 cases)

Case	What the AI does	Result	Limits and source	Sessions
Edo State, Nigeria: GPT-4 after-school tutoring, randomised trial (World Bank)	Students used Microsoft Copilot (GPT-4) as a virtual English tutor in an after-school programme, working in pairs with teachers present. The trial compared them with students randomly left out.	Gains of about 0.3 standard deviations over six weeks, described as nearly two years of typical learning, and better than about 80% of interventions in a database of developing-country trials (World Bank blog, Jan 2025). The working paper gives 0.31 SD on a combined test (English, AI knowledge, digital skills) and 0.23 SD on English alone; nine schools.	Six-week pilot. "Two years of learning" is a comparison, not a measurement. Full-year projections in the paper are model-based extrapolations.	5
Rising Academies "Rori": WhatsApp maths tutor in Ghana	Rori is a chat-based maths tutor delivered through WhatsApp on basic phones. Students used it for two 30-minute sessions a week for 8 months on top of normal lessons.	About 1,000 students in grades 3-9 across 11 schools; effect size 0.37 on maths growth scores ($p < 0.001$), year 1 only.	Not a randomised trial at student level (schools assigned to arms); year-1 results only; authors are affiliated with Rising Academies.	
Harvard: purpose-built AI physics tutor versus active-learning class	Instructors built a tutor on the GPT API with lesson-specific instructions so it coached like an experienced teacher instead of giving answers. Students did one lesson with the tutor at home and one in an active-learning class, then switched.	194 students. Learning gains in the AI-tutored condition were about double those in the in-class condition (preliminary analysis reported by Harvard). Published version: Kestin et al., Scientific Reports 15, 17458 (2025).	One course, two topics, short-term learning, highly selective students. The tutor was carefully designed, not off-the-shelf ChatGPT.	7
EIDU (Kenya): AI-generated tutoring plans in public primary classrooms	A generative AI model built with Google.org support spots each child's learning gaps and produces short (about 15-minute) tutoring plans for small groups. Teachers use the plans for catch-up within EIDU's structured lessons.	No published result for the AI tool. EIDU's wider structured-pedagogy approach shows preliminary literacy and numeracy gains of 0.5 standard deviations; a three-arm randomised evaluation is planned.	Pilot only. The 0.5 SD figure is for the non-AI programme. Use as "East African case to watch", not as evidence. No rigorous East African AI-tutor trial was found.	
Georgia State University: "Pounce" admissions chatbot cuts summer melt	A text-message chatbot answered admitted students' questions on financial aid, forms and deadlines and nudged them through enrolment steps. Staff dealt only with questions it could not handle.	Of more than 7,000 admitted students, half got the chatbot. Summer melt (admitted students who never enrol) was 21.4% lower than in the control group, and enrolment 3.9% higher. Less than 1% of over 50,000 student messages needed staff attention.	Old (2016) and pre-generative AI. The enrolment gain is reported as 3.9% or 3.3% depending on the subgroup.	11
Australian Catholic University: AI-detector accusations of cheating	Turnitin's AI-writing indicator scored student essays for likely AI generation, and the university opened misconduct cases on that basis. Students had to prove they had not used AI.	Nearly 6,000 alleged misconduct cases across nine campuses in 2024, about 90% AI-related (internal documents, per ABC; ACU says "substantially overstated"). Turnitin warns its reports should not be the sole basis for adverse action. ACU dropped the AI indicator in March 2025; about a quarter of referrals were dismissed; the university said it regretted the ...	The 6,000 and 90% figures come from internal documents that ACU disputes. Say how many students were wrongly accused is unknown.	4, 5, 8, 9, 10, 12
Chegg: an edtech business disrupted by free generative AI	This is AI as a competitor rather than a tool. Students moved to free assistants such as ChatGPT, and Google's AI Overviews answer questions in search, so less traffic reaches Chegg.	May 2025: Chegg cut about 22% of staff (248 people). Q1 2025 subscribers fell 31% to 3.2 million and revenue fell 30% to USD 121 million. Chegg sued Google in February 2025 over AI Overviews.	Chegg also cites macroeconomic factors. A reported further 45% cut in October 2025 came from a low-quality source and is excluded.	

Legal and professional services (7 cases)

Case	What the AI does	Result	Limits and source	Sessions
Mata v Avianca: lawyers fined for citing cases invented by ChatGPT	A lawyer used ChatGPT for legal research, and it produced court decisions that do not exist, with fake quotations. When asked, ChatGPT insisted one case "does indeed exist".	Judge P. Kevin Castel imposed a USD 5,000 penalty on the two lawyers and their firm, and ordered them to notify their client and each real judge falsely named as author of a fake opinion. The court found bad faith partly because they did not admit the problem when first challenged (March 2023), only after an order to show cause (May 2023).	Refer to the firm and the case, not to the individual lawyers by name, in slides.	5
Mavundla v MEC (South Africa): seven of nine cited cases could not be found	The legal team's filings cited case authorities, most of which turned out not to exist; the court suspected generative AI. The judge's own check with ChatGPT also wrongly "confirmed" one case existed.	Of nine authorities cited, only two could be found (one wrongly cited). The firm was ordered to pay the costs of two September 2024 hearings, leave to appeal was dismissed, and the judgment was referred to the Legal Practice Council.	Later South African matter (Northbound Processing v SA Diamond and Precious Metals Regulator, 2025) reportedly followed the same pattern; not verified here.	5
Ayinde v Haringey and Al-Haroun v Qatar National Bank (England): High Court warning to firm leaders	In two unrelated cases, court papers cited non-existent or misquoted cases, with generative AI the likely source. The court heard both together to set out the profession's duties.	Ayinde: five non-existent cases; barrister referred to her regulator (contempt threshold met but proceedings not started); earlier wasted-costs order of GBP 2,000 each against the barrister and the law centre. Al-Haroun: of 45 citations, 18 did not exist and many others were misquoted; solicitor referred to the Solicitors Regulation Authority. The court ...	Name organisations and the judgment, not individual lawyers, in class.	
Deloitte Australia: partial refund for a government report with fabricated references	Deloitte used a generative AI tool chain (Azure OpenAI GPT-4o, licensed by the department) in preparing an independent review. The first version contained fake academic references and a made-up quote from a Federal Court judgment.	Contract value AU$440,000. A University of Sydney academic found the errors; the corrected version removed more than a dozen bogus references and disclosed AI use. Deloitte agreed to repay the final instalment of the contract. DEWR said the substance and recommendations were unchanged.	Exact refund amount differs between outlets; say "the final instalment". Deloitte's internal review reportedly blamed human error rather than AI misuse.	5, 9
Allen & Overy (now A&O Shearman): firm-wide rollout of Harvey	Harvey, a generative AI platform built on OpenAI models, lets lawyers ask in plain language for drafts and research in contracts, due diligence, litigation and compliance. Output must be reviewed by an A&O lawyer.	During the trial about 3,500 lawyers across 43 offices submitted around 40,000 queries for client work. No productivity figure published.	Adoption figures, not outcomes. Dated 2023.	8
PwC: ChatGPT Enterprise for 100,000+ staff and a USD 1 billion AI plan	PwC gave more than 100,000 US and UK staff ChatGPT Enterprise, with custom GPTs being built to review tax returns, draft proposal responses and help software developers. It also became OpenAI's first reseller of the product to clients.	No measured staff outcome published. PwC had identified more than 3,000 internal generative AI use cases, nearly 40% addressed by internal tools; this follows a USD 1 billion, three-year AI plan announced April 2023 (including upskilling staff).	Deployment and spending, not results. Pair with LGL-04 to show the same sector's upside and downside.	6, 11

Case	What the AI does	Result	Limits and source	Sessions
Kenya Judiciary: draft AI policy and practice directions after fake citations	This is governance rather than a tool. After several judges struck out pleadings containing AI-generated content and non-existent case citations, the Judiciary drafted rules on AI use in court.	Draft rules: advocates must disclose AI use when filing; must verify every authority, statute and principle cited; may not file wholly AI-generated documents without "meaningful human review"; judicial officers must verify AI output too. Penalties not stated. No published figure on number of incidents.	Check the Judiciary's website for the final adopted text before teaching. A May 2025 TechCabal report of a Supreme Court warning by Justice Lenaola could not be opened and is not relied on. Nigeria's Bar Association issued AI guidelines in 2024 (search result ...	1, 13

Search, African-language models and Uganda (21 cases)

Case	What the AI does	Result	Limits and source	Sessions
Telstra: "Ask Telstra", a search assistant over the company's own knowledge bases	Frontline staff type a question, and Ask Telstra searches Telstra's internal knowledge bases and writes an answer, using Azure OpenAI and Azure AI Search. A second tool, One Sentence Summary, condenses a customer's recent notes and transactions so the agent does not have to read the whole history.		These are company figures and no independent audit was found. The pilot measures are survey agreement, not productivity. The "over a minute" call-time figure has no published baseline.	4, 7, 8
McKinsey: "Lilli", an assistant over the firm's own knowledge	Lilli searches and summarises McKinsey's internal knowledge base (past work, research and experts) for consultants. Its add-ons draft slides from a prompt and check that documents use the firm's tone of voice.	Over 75% of the firm's employees use it on an ongoing monthly basis (Kate Smaje, global leader of technology and AI, June 2025). No time-saved figure is published.	Usage is not value. Fortune reports that the tool takes over some tasks typically done by junior staff. McKinsey's position is that headcount need not fall, because staff move to client work. Other outlets give "over 70%" and "about 17 uses a week"; I did not ... Source: "McKinsey is using AI to create PowerPoints and take over junior employee tasks", Fortune, 2 Jun 2025; accessed 11 Nov 2026.	0, 8
UK Government "Consult": AI that reads public consultation responses	It reads thousands of free-text replies to a public consultation, groups them into themes and counts them. Civil servants then check and correct the themes.	More than 50,000 responses were categorised in about 2 hours for £240 of compute, and experts spent 22 hours checking the output. The AI agreed with one or both expert groups almost 83% of the time. The two human groups agreed with each other only 55% of the time (F1 0.79 and 0.82 for the AI, versus 0.74 between the human groups). The government projects up ...	The 75,000 days and £20 million are government projections, not audited savings. Experts quoted in the trade press warn that themes can miss nuance. Teaching point: the right benchmark is how often humans agree with each other (55%), not 100%. Source: "Ground-breaking use of AI saves taxpayers' money and delivers greater government efficiency", GOV.UK press release, 16 Oct 2025; accessed 11 Nov 2026.	4, 7
A generative AI assistant for 5,179 support agents (field study)	While agents chat with customers, the assistant suggests replies and links to relevant internal documentation. It was rolled out to agents in stages, which let researchers compare agents with and without it.	Issues resolved per hour rose 14% on average. Novice and low-skilled agents improved 34%, with minimal impact on experienced, highly skilled agents.	The firm is unnamed, so present it as research evidence, not a named company case. The gains go mostly to newer staff, which matters for how leaders design training and pay. Source: "Generative AI at Work", NBER Working Paper 31161, Apr 2023 (rev. Nov 2023); accessed 11 Nov 2026.	9
Standard Bank: an employee service-desk bot, then generative AI at scale	"Karabo", built on Microsoft Copilot Studio, answers employees' IT and technology questions; it replaced two older custom-coded bots. Since then, generative AI tools are being used across the group under a list of approved use cases.		The 99% figure is a vendor claim with no stated measure; it may mean "answered without human handover", not "answered correctly". A September 2026 Business Day piece reportedly gives a different headcount, which I did not read, so quote the percentage only. ...	4, 7, 8, 14
Absa: Copilot for 30,000 staff, staff-built agents, and contact-centre gains	Staff use Microsoft Copilot in everyday Office work, and some build their own small automation agents. The contact centre runs on Amazon Connect with AI features, and a customer chatbot answers routine queries.	More than 30,000 employees use Copilot each month. 4,400 staff with Copilot Pro licences build agents, and more than 3,800 agents are in production. More than 1,400 developers use AI coding tools. In the contact centre, response times fell by up to 21%, handling time by 14% per call and holding time by 44%. The chatbot handles more than 100,000 queries a ...	These are company figures. The contact-centre gains may come from the new platform as a whole, not AI alone. Search results also mention an "AI gateway" with more than 120 models and more than 40 guardrails; I could not open that page, so do not quote it. No ... Source: "Absa's AI is writing its code and answering its calls", TechCentral, 19 Aug 2026; accessed 11 Nov 2026.	6, 7

Case	What the AI does	Result	Limits and source	Sessions
Webber Wentzel: firm-wide rollout of the Legora legal AI platform	Legora is a legal AI workspace for reviewing, researching and drafting across a firm's documents. Webber Wentzel rolled it out across the firm and made it the anchor technology of an innovation lab that builds tools for African legal markets.	No published result. The firm says it chose Legora after a year-long evaluation against other platforms.	An announcement, not results. Pair it with A&O Shearman and Harvey (LGL-05) and the fake-citation cases (LGL-01 to LGL-03) to discuss vendor choice in law. Source: "Leading SA firm Webber Wentzel rolls out Legora as part of 'multi-faceted partnership'", Legal IT Insider, 26 Aug 2025; accessed 11 Nov 2026.	
Uganda: ULII's AI case summaries and the Judiciary's AI transcription push	ULII, Uganda's free online library of laws and judgments, added AI summaries of long judgments, automatic links to the laws and cases a judgment cites, and alerts when relevant new decisions appear. Separately, the Judiciary bought AI transcription software to produce court records faster.	No published result on accuracy or time saved. Scale and context:	Whether the 1 July 2026 paperless deadline was met is unconfirmed. There is no accuracy figure for the summaries or the transcription. A good discussion: grounding AI in an authoritative local source (ULII) is the defence against invented citations, compared ...	
Sunbird AI "Sunflower": how a Ugandan model was built and how it scores against GPT-4o and Gemini	Sunflower 14B and 32B are language models for Ugandan languages. Sunbird built them by further training an open model from China's Alibaba (Qwen 3) rather than training from scratch. The training data came from existing corpora, OCR of printed books, dictionaries and proverbs, and more than 500 ...	Sunbird reports "state of the art" comprehension in most Ugandan languages; the paper claims the best accuracy in 24 of 31 languages evaluated. Mean chrF translation scores (higher is better):	The scores were self-reported and not independently replicated. The paper is inconsistent on whether the 14B or the 32B model wins the 24 of 31 languages. A "home-grown" model built on a Chinese open model is a good sovereignty debate. No user or impact ... Source: "Sunflower: A New Approach To Expanding Coverage of African Languages in Large Language Models", Sunbird AI, arXiv:2510.07203, 8 Oct 2025; accessed 11 Nov ...	4, 6, 8
Lelapa AI: a small model for African languages (InkubaLM) and a paid language API (Vulavula)	InkubaLM is a deliberately small, open model for Swahili, Hausa, isiZulu, isiXhosa and Yoruba, built to run cheaply. Vulavula is a paid service that businesses plug into their apps for transcription, translation and text analysis in African languages.	InkubaLM has 0.4 billion parameters and was pre-trained on 2.4 billion tokens. The authors say it achieves "performance comparable to models with significantly larger parameter counts" and outperforms many larger models in sentiment analysis. The same paper shows it trailing larger models such as LLaMA 3-8B on several tasks, especially African-to-English ...	"Comparable" is the authors' summary, and the detailed tables are mixed. Training compute was donated by Microsoft's AI for Good Lab (per search results; not opened).	4, 6
Masakhane: a volunteer research community builds African-language translation	Volunteers, many without formal research training, built translation datasets and models for their own languages and published them openly. The method is "participatory research": the speakers of a language take part in building the AI for it.	More than 400 participants from at least 20 countries. 46 published translation benchmarks (English into 39 African languages, French into two more, and three languages into English), with human evaluation for about a third.	These are research benchmarks, not business deployments. The value for leaders is the model of building data and talent together. Many later African language projects drew on this community, including people now at Lelapa AI and Sunbird; that link is not ... Source: "Participatory Research for Low-resourced Machine Translation: A Case Study in African Languages", Masakhane (Nekoto et al.), arXiv 2010.02353, late 2020 ...	4
Jacaranda Health "UlizaLlama": an open Swahili health model built on Llama 3	UlizaLlama is an open-source language model for health questions in Kiswahili. Jacaranda built it on Meta's Llama 3 and trained it on messages from its PROMPTS SMS service, so it can write tailored replies to pregnant women and new mothers instead of pre-written ones.		The 30% error figure is Jacaranda's own estimate, with no published method; ask "error compared with what?" HLT-02 covers the earlier PROMPTS triage model; this case is about building the language model. A NeurIPS 2025 demo reportedly mentions "UlizaMama" ...	2, 4, 6, 11, 12

Case	What the AI does	Result	Limits and source	Sessions
Nigeria N-ATLaS: a government-backed open multilingual model	An open-source model meant to understand and generate Nigerian languages and Nigerian-accented English, offered as a free "digital public good" for builders in education, health, commerce and government.	No published usage result. Awarri built it; more than 7,000 fellows from the 3MTT Nigeria programme support the project (Nairametrics). NCAIR's director called it strategic infrastructure for Nigeria's AI future.	The pages I read do not name the languages, base model or licence. Search results say Yoruba, Hausa, Igbo and Nigerian English, built on Llama; check the Hugging Face model card (NCAIR1/N-ATLaS) before quoting. Commentators describe it as a foundation, not a ...	
Cassava Technologies and Nvidia: Africa's first "AI factory" (rented GPUs on the continent)	A GPU computing centre in Africa that universities, start-ups, banks and government can rent for training and running AI, instead of sending the work to data centres abroad.		The sources differ on the investment figure (US$700 million versus US$720 million). No utilisation or customer figures are published. Kenya and Nigeria are planned, not live. No Uganda site is announced.	0, 1, 6
Microsoft and G42 in Kenya: a US$1 billion geothermal AI data centre that stalled over power	President Ruto said one data centre would need 1,000 MW when Kenya had 2,300 MW, which would mean switching off "half the country"; Kenya was load-shedding daily from 5 pm to 10 pm (Citizen Digital, May 2026). ThinkGeoEnergy (8 May 2026) reports Kenya suspended the project after Treasury declined ...		Say "stalled; the government says it is not abandoned". The capacity figures do not match (Ruto's 2,300 MW versus peak demand above 3,000 MW in the same article). Teaching point: compute sovereignty depends on electricity first.	0, 6
AirQo (Makerere University) and KCCA: low-cost sensors and machine learning for Kampala's air	Cheap locally built sensors (on buildings and some boda bodas) measure fine dust. Machine learning corrects ("calibrates") their readings against expensive reference monitors, and KCCA uses an AI air-quality index to spot the most polluted areas.		Check the RMSE numbers in the full paper before putting them on a slide. Sensor counts vary by date (65 to more than 100). There is no measured health outcome. The SciDev article does not name AirQo, though other sources link KCCA's network to it.	
Uganda's Personal Data Protection Office rules against Google	Four Ugandans complained that Google processed their data without registering with the PDPO and moved it abroad without safeguards. Google argued Uganda's law did not apply because it is not based there. The PDPO rejected that argument.	Google was found to be a data controller and collector under Ugandan law, in breach of the registration requirement, and to have transferred personal data outside Uganda without showing adequate safeguards. It was ordered to register within 30 days and to submit evidence of a compliant cross-border transfer framework. No compensation was reported.	This is not an AI case as such. Use it for the vendor and cloud question: an offshore AI tool that handles customer data must still meet Uganda's registration and transfer rules. Google could appeal to the Minister of ICT; the outcome of any appeal was not ... Source: "Uganda's Data Protection Office finds Google in breach of privacy", Uganda Registration Services Bureau, Aug 2025; accessed 11 Nov 2026. Also reported by New ...	
Uganda's Ministry of ICT: a National Data Strategy before the National AI Strategy	A five-year National Data Strategy to fix how government bodies collect, store and share data, explicitly as groundwork for the national AI strategy. In parallel, the ministry hired a Kenyan firm, led by University of Nairobi professor Timothy Waema, to draft a national strategy for AI and emerging ...	The baseline survey found data for only 36% of the indicators in the Fourth National Development Plan (NDP IV); the target is 80% within five years. Agencies such as UBOS, NIRA and DCIC run isolated databases with different standards, so citizens resubmit the same records. The strategy has three pillars (governance, infrastructure, use), oversight by a ...	As of 11 Nov 2026 I found no confirmation that the national AI strategy has been published (PUB-06 recorded a June 2026 target). The 36% figure is the cleanest Ugandan "data before AI" number found.	
Centenary Group and Huawei: an AI and "agentic banking" partnership	A memorandum of understanding under which Huawei will support Centenary on AI to automate routine banking tasks, improve fraud detection and risk management, and speed up loan approvals using alternative customer data. It also covers cloud, data-centre upgrades, cybersecurity and staff training.	No published result (an MoU only). Centenary serves more than 4 million customers. The chairman, Prof. John Ddumba-Ssentamu, called it the most significant agreement the group has signed in a generation.	An intention, not a deployment. Alternative-data lending raises consent and data-protection questions under the 2019 Act (see GAP-17). It is the only named Ugandan-bank AI commitment found with any detail. Source: "Centenary Bank partners with Huawei in AI drive to break rural banking barriers in Uganda", Business Times Uganda, 23 May 2026; accessed 11 Nov 2026. Also ...	10

GitHub Copilot controlled lab experiment	developers were asked to write an HTTP server in JavaScript as fast as possible, with or without the Copilot code-completion assistant.	the Copilot group "completed the task 55.8% faster" than the control group.	This was a single, simple lab task, and the authors included GitHub staff, so it is effectively vendor research. Use PPL-04 for the real-workplace figure. Source: "The Impact of AI on Developer Productivity: Evidence from GitHub Copilot", arXiv 2302.06590, (13 Feb 2023).	
Copilot field experiments at Microsoft, Accenture and a Fortune 100 firm	a random subset of working developers got an AI code-completion assistant during normal work, and their output was compared with colleagues who did not.	across three experiments and 4,867 developers, completed tasks rose 26.08% (standard error 10.3%). Less experienced developers adopted more and gained more.	Authors include Microsoft staff. Each single experiment was noisy, and the 26% is a pooled estimate. It is much smaller than PPL-03's 55.8%, which is a useful contrast in class. Source: "The Effects of Generative AI on High-Skilled Work: Evidence from Three Field Experiments with Software Developers", Microsoft Research, (June 2025). Also ...	
Klarna: "work of 700 agents", then back to humans	an OpenAI-powered assistant answers customer-service chats in many languages. In 2025 the CEO said cost had driven the strategy too far and that quality had suffered.	Klarna's press release (27 Feb 2024) claimed that in its first month the assistant handled 2.3 million conversations, two-thirds of service chats, equal to the work of 700 full-time agents. It claimed resolution in under 2 minutes (down from 11), 25% fewer repeat inquiries, an estimated USD 40 million profit improvement in 2024, 23 markets and 35+ ...	The "700 agents" and USD 40m are Klarna's own one-month figures, not audited. The reversal comes from a CEO interview, and Klarna said it still aims to shrink headcount through attrition. Source: Klarna press release, "Klarna AI assistant handles two-thirds of customer service chats in its first month", (27 Feb 2024). "Klarna Is Hiring Customer Service ...	5, 12
IBM: back-office roles AI could replace	the CEO said AI and automation could take over routine back-office work such as HR verification letters and internal transfers. He said hiring for such roles would slow or pause.	CEO Arvind Krishna said he could "easily see 30%" of about 26,000 non-customer-facing roles replaced over five years, which implies about 7,800 roles. IBM said part of the reduction would come from not refilling roles vacated through attrition.	This is a CEO projection, not a measured outcome or a layoff announcement. Other coverage reported that IBM denied a "blanket" hiring pause. Source: "IBM CEO ... pause hiring", Fortune (syndicating a Bloomberg interview), (1 May 2023).	9

Case	What the AI does	Result	Limits and source	Sessions
Duolingo's "AI-first" memo and walk-back	the April 2025 memo said the company would gradually stop using contractors for work AI can handle, and add headcount only where teams cannot automate more. After public backlash the CEO said he had not given enough context.	no published figure on contractor reductions. In August 2025 the CEO told the New York Times the company has never laid off full-time employees and does not plan to.	There is no data on contractor numbers. Teach it as a communication and change-management case, not a jobs statistic. Source: "Duolingo CEO admits controversial AI memo did not give enough context...", Fortune, (18 Aug 2025).	
WEF Future of Jobs Report 2025	a survey of over 1,000 large employers, representing over 14 million workers, on expected job and skill changes to 2030.	170 million jobs created and 92 million displaced by 2030, a net 78 million. 39% of workers' existing skill sets will be transformed or outdated. 85% of employers plan to prioritise upskilling. 40% expect to reduce headcount where automation can replace tasks.	These are employer expectations, not outcomes. The 170m/92m figures cover all drivers of change, not AI alone. Source: "170 million jobs to emerge by 2030 but 92 million at risk, WEF warns", People Matters, (article 24 Feb 2026, reporting the Jan 2025 report). Primary: WEF ...	12
IMF: share of jobs exposed to AI	the IMF estimated how many jobs AI could affect, by income level.	almost 40% of global employment is exposed to AI. The figure is about 60% in advanced economies, 40% in emerging markets and 26% in low-income countries. In advanced economies, roughly half of exposed jobs may benefit and half may see lower labour demand.	"exposed" means affected, not lost. Lower exposure in low-income countries also means smaller productivity gains (see ADO-09). Source: "AI Will Transform the Global Economy. Let's Make Sure It Benefits Humanity", IMF Blog, (14 Jan 2024).	12
ILO: refined global index of generative AI exposure	an occupation-by-occupation estimate of how exposed jobs are to generative AI.	about one in four workers globally is in an occupation with some generative-AI exposure. 3.3% of global employment is in the highest-exposure category. Exposure is 11% of employment in low-income countries and 34% in high-income countries. In the top category, women are more exposed (4.7%) than men (2.4%).	The page gives no Africa-specific figures. Use the low-income-country figure as a proxy and say so. Source: "Generative AI and jobs: A refined global index of occupational exposure", ILO Working Paper 140, (20 May 2025).	12
Microsoft Work Trend Index 2024: "bring your own AI"	a survey of about 31,000 knowledge workers on AI use at work.	75% of knowledge workers use generative AI at work. 78% of AI users bring their own AI tools to work. 52% are reluctant to admit using it for their most important tasks. 66% of leaders would not hire someone without AI skills. Only 39% of users have received AI training from their company.	This is a vendor survey, and Microsoft sells AI tools. No African countries were sampled. Source: "AI at Work Is Here. Now Comes the Hard Part", Microsoft WorkLab, (8 May 2024).	
BCG AI at Work 2025: frontline stall and shadow AI	an annual survey of over 10,600 leaders, managers and frontline staff.	regular AI use among frontline employees has stalled at 51%. 54% say they would use AI tools even if not authorised. 41% worry their job could disappear within ten years. Only 36% feel adequately trained. Only 25% of frontline workers say leaders give enough AI guidance.	The 54% applies to all respondents, not only frontline staff. The sample is white-collar workers. Source: BCG press release, "AI at Work 2025", (26 Jun 2025).	12
Microsoft AI skilling pledges in Kenya and Nigeria	national programmes to train citizens and public servants in AI and cybersecurity skills.	Kenya: train 1 million people by 2027 (announced Nov 2024) through the Kenya Skills Hub and Smart Academy. Nigeria: USD 1 million over two years to train 1 million Nigerians (announced Feb 2025). No published completion figures.	These are pledges, not outcomes. The Nigeria budget works out to about USD 1 per trainee, which critics noted. Training reach is not the same as workplace adoption.
